

z/OS Communications Server
3.2

*IP Messages:
Volume 2 (EZB, EZD)*

Note:

Before using this information and the product it supports, be sure to read the general information under [“Notices” on page 1493](#).

This edition applies to 3.1 of z/OS® (5655-ZOS), and to subsequent releases and modifications until otherwise indicated in new editions.

About this document

This document describes the Internet Protocol (IP) messages that occur in z/OS Communications Server. The information in this document supports both IPv6 and IPv4. Unless explicitly noted, information describes IPv4 networking protocol. IPv6 support is qualified in the text.

For information about how to set up, initialize, and customize your Transmission Control Protocol/Internet Protocol (TCP/IP) services system, see the [z/OS Communications Server: IP Configuration Reference](#), the [z/OS Communications Server: IP Configuration Guide](#) and the [z/OS Communications Server: IP Programmer's Guide and Reference](#). For information about how to use the applications on your TCP/IP system, see [z/OS Communications Server: IP User's Guide and Commands](#).

This document refers to Communications Server data sets by their default SMP/E distribution library name. Your installation might, however, have different names for these data sets where allowed by SMP/E, your installation personnel, or administration staff. For instance, this document refers to samples in SEZAINST library as simply in SEZAINST. Your installation might choose a data set name of SYS1.SEZAINST, CS390.SEZAINST or other high level qualifiers for the data set name.

Who should read this document

This document assists TCP/IP operators, system programmers, and users to:

- Analyze a problem
- Classify the problem as a specific type
- Describe the problem to the IBM® Software Support Center

Familiarity with TCP/IP concepts and terms is assumed.

How this document is organized

The messages are listed in alphanumeric order by message ID. For each message ID, the books contains the text and a description of the message. This book contains the following chapters:

- [Chapter 2, “EZB0xxxx messages,” on page 7](#) contains messages in the EZB0xxxx range.
- [Chapter 3, “EZB1xxxx messages,” on page 153](#) contains messages in the EZB1xxxx range.
- [Chapter 4, “EZB2xxxx messages,” on page 187](#) contains messages in the EZB2xxxx range.
- [Chapter 5, “EZB3xxxx messages,” on page 293](#) contains messages in the EZB3xxxx range.
- [Chapter 6, “EZB4xxxx messages,” on page 447](#) contains messages in the EZB4xxxx range.
- [Chapter 7, “EZB6xxxx messages,” on page 511](#) contains messages in the EZB6xxxx range.
- [Chapter 8, “EZB9xxxx messages,” on page 513](#) contains common messages that are called by several application and function components. These messages are in the EZB9xxxx range.
- [Chapter 9, “EZBHxxxx messages,” on page 515](#) contains IBM Health Checker for z/OS messages in the EZBHxxxx range.
- [Chapter 10, “EZD0xxxx messages,” on page 541](#) contains messages in the EZD0xxxx range.
- [Chapter 11, “EZD1xxxx messages,” on page 719](#) contains messages in the EZD1xxxx range.
- [Chapter 12, “EZD2xxxx messages,” on page 1387](#) contains messages in the EZD2xxxx range.
- [Appendix A, “Related protocol specifications,” on page 1471](#) lists the related protocol specifications for TCP/IP.
- [Appendix B, “Accessibility,” on page 1491](#) describes accessibility features to help users with physical disabilities.
- [“Notices” on page 1493](#) contains notices and trademarks used in this document.

- “Bibliography” on page 1497 contains descriptions of the documents in the z/OS Communications Server library.

How to use this document

To use this document, you should be familiar with z/OS TCP/IP Services and the TCP/IP suite of protocols.

How to provide feedback to IBM

We welcome any feedback that you have, including comments on the clarity, accuracy, or completeness of the information. See, [How to send feedback to IBM](#) for additional information.

Conventions and terminology that are used in this information

Commands in this information that can be used in both TSO and z/OS UNIX environments use the following conventions:

- When describing how to use the command in a TSO environment, the command is presented in uppercase (for example, NETSTAT).
- When describing how to use the command in a z/OS UNIX environment, the command is presented in bold lowercase (for example, **netstat**).
- When referring to the command in a general way in text, the command is presented with an initial capital letter (for example, Netstat).

All the exit routines described in this information are *installation-wide exit routines*. The installation-wide exit routines also called installation-wide exits, exit routines, and exits throughout this information.

The TPF logon manager, although included with VTAM®, is an application program; therefore, the logon manager is documented separately from VTAM.

Samples used in this information might not be updated for each release. Evaluate a sample carefully before applying it to your system.

z/OS no longer supports mounting HFS data sets (The POSIX style file system). Instead, a z/OS File System (zFS) can be implemented. The term hierarchical file system, abbreviated as HFS, is defined as a data structure that has a hierarchical nature with directories and files. References to hierarchical file systems or HFS might still be in use in z/OS Communications Server publications.

Network Express and Open Systems Adapter-Express (OSA-Express) terminology:

- The Network Express feature is introduced with the IBM z17 processor family. The Network Express feature is the next generation of Open Systems Adapter (OSA) technology. The term OSA (Open Systems Adapter) is carried forward with Network Express. The IBM z17 processor supports both the Network Express and the OSA-Express7S features. In this information, when a general reference is made to OSA that applies to all these features, then the term OSA is used, and the acronym will appear in italics. This formatting style and guideline for usage for the term OSA is used throughout this document. When a distinction is necessary, then the specific feature name is used such as the Network Express feature
- The Network Express feature is defined as channel (CHPID) type OSH (Open System Adapter for Hybrid networks) that might operate in either 10 GbE or 25 GbE link speed. When this term is used in this information, the processing being described applies to either link speed. If processing is applicable to only one link speed, the full terminology, for instance, IBM 25 GbE Network Express will be used.
- Network Express is defined with new system architecture called Enhanced Queued Direct I/O (EQDIO). In this information there are many references to QDIO or OSA/QDIO. When the reference applies to both QDIO and EQDIO the reference just indicates OSA. When the reference is specific to the QDIO or EQDIO architecture, then the specific architecture is referenced, for example, OSA/QDIO or OSA/EQDIO. Some OSA references also use or include the channel type for OSA such as OSD (QDIO). When the reference applies to both features, then the term OSA is used. When a distinction is necessary then the specific channel or architecture type is used, OSD/QDIO or OSH/EQDIO.

Shared Memory Communications over Remote Direct Memory Access (SMC-R) terminology

- *RoCE* , which is a generic term representing IBM® 10 GbE RoCE Express, IBM 10 GbE RoCE Express2, IBM 25 GbE RoCE Express2, IBM 10 GbE RoCE Express3, IBM 25 GbE RoCE Express3, IBM 10 GbE Network Express and IBM 25 GbE Network Express feature capabilities. When this term is used in this information, the processing being described applies to all of these features. If processing is applicable to only one feature, the full terminology, for instance, Network Express will be used.
- RoCE Express2, which is a generic term representing an IBM RoCE Express2 feature that might operate in either 10 GbE or 25 GbE link speed. When this term is used in this information, the processing being described applies to either link speed. If processing applies to only one link speed, the full terminology, for instance, IBM 25 GbE RoCE Express2 will be used.
- RoCE Express3, which is a generic term representing an IBM RoCE Express3 feature that might operate in either 10 GbE or 25 GbE link speed. When this term is used in this information, the processing being described applies to either link speed. If processing applies to only one link speed, the full terminology, for instance, IBM 25 GbE RoCE Express3 will be used.
- Network Express, which is a generic term representing an Network Express feature that might operate in either 10 GbE or 25 GbE link speed. When this term is used in this information, the processing being described applies to either link speed. If processing is applicable to only one link speed, the full terminology, for instance, IBM 25 GbE Network Express will be used. When configured with a CHPID type of NETH, the Network Express feature may operate as an RDMA network interface card.
- RDMA network interface card (RNIC), which is used to refer to the IBM 10 GbE RoCE Express, IBM 10 GbE RoCE Express2, IBM 25 GbE RoCE Express2, IBM 10 GbE RoCE Express3, or IBM 25 GbE RoCE Express3, IBM 10 GbE Network Express or IBM 25 GbE Network Express feature.
- Shared RoCE environment, which means that the *RoCE* feature can be used concurrently, or shared, by multiple operating system instances. The feature is considered to operate in a shared RoCE environment even if you use it with a single operating system instance.

Clarification of notes

Information traditionally qualified as Notes is further qualified as follows:

Attention

Indicate the possibility of damage

Guideline

Customary way to perform a procedure

Note

Supplemental detail

Rule

Something you must do; limitations on your actions

Restriction

Indicates certain conditions are not supported; limitations on a product or facility

Requirement

Dependencies, prerequisites

Result

Indicates the outcome

Tip

Offers shortcuts or alternative ways of performing an action; a hint

Prerequisite and related information

z/OS Communications Server function is described in the z/OS Communications Server library. Descriptions of those documents are listed in [“Bibliography” on page 1497](#), in the back of this document.

Required information

Before using this product, you should be familiar with TCP/IP, VTAM, MVS, and UNIX System Services.

Softcopy information

Softcopy publications are available in the following collection.

Titles	Description
<i>IBM Z Redbooks</i>	The IBM Z [®] subject areas range from e-business application development and enablement to hardware, networking, Linux [®] , solutions, security, parallel sysplex, and many others. For more information about the Redbooks [®] publications, see http://www.redbooks.ibm.com/ and http://www.ibm.com/systems/z/os/zos/zfavorites/ .

Other documents

This information explains how z/OS references information in other documents.

When possible, this information uses cross-document links that go directly to the topic in reference using shortened versions of the document title. For complete titles and order numbers of the documents for all products that are part of z/OS, see [z/OS Information Roadmap \(SA23-2299\)](#). The Roadmap describes what level of documents are supplied with each release of z/OS Communications Server, and also describes each z/OS publication.

To find the complete z/OS library, visit the [z/OS library](#) in [IBM Documentation](#) (<https://www.ibm.com/docs/en/zos>).

Relevant RFCs are listed in an appendix of the IP documents. Architectural specifications for the SNA protocol are listed in an appendix of the SNA documents.

The following table lists documents that might be helpful to readers.

Title	Number
<i>DNS and BIND</i> , Fifth Edition, O'Reilly Media, 2006	ISBN 13: 978-0596100575
<i>Routing in the Internet</i> , Second Edition, Christian Huitema (Prentice Hall 1999)	ISBN 13: 978-0130226471
<i>sendmail</i> , Fourth Edition, Bryan Costales, Claus Assmann, George Jansen, and Gregory Shapiro, O'Reilly Media, 2007	ISBN 13: 978-0596510299
<i>SNA Formats</i>	GA27-3136
<i>TCP/IP Illustrated, Volume 1: The Protocols</i> , W. Richard Stevens, Addison-Wesley Professional, 1994	ISBN 13: 978-0201633467
<i>TCP/IP Illustrated, Volume 2: The Implementation</i> , Gary R. Wright and W. Richard Stevens, Addison-Wesley Professional, 1995	ISBN 13: 978-0201633542
<i>TCP/IP Illustrated, Volume 3: TCP for Transactions, HTTP, NNTP, and the UNIX Domain Protocols</i> , W. Richard Stevens, Addison-Wesley Professional, 1996	ISBN 13: 978-0201634952

The z/OS Basic Skills Information Center

The z/OS Basic Skills Information Center is a web-based information resource intended to help users learn the basic concepts of z/OS, the operating system that runs most of the IBM mainframe computers in use today. The Information Center is designed to introduce a new generation of Information Technology professionals to basic concepts and help them prepare for a career as a z/OS professional, such as a z/OS systems programmer.

Specifically, the z/OS Basic Skills Information Center is intended to achieve the following objectives:

- Provide basic education and information about z/OS without charge
- Shorten the time it takes for people to become productive on the mainframe
- Make it easier for new people to learn z/OS

To access the z/OS Basic Skills Information Center, open your web browser to the following website, which is available to all users (no login required): <https://www.ibm.com/support/knowledgecenter/zosbasics/com.ibm.zos.zbasics/homepage.html?cp=zosbasics>

Summary of changes for IP Messages: Volume 2 (EZB, EZD)

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability. Technical changes or additions to the text and illustrations for the current edition are indicated by a vertical line to the left of the change.

Summary of message changes for z/OS 3.2 Communications Server: IP Messages Volume 2 (EZB, EZD) for z/OS 3.2

The following messages are new, changed, or no longer issued for z/OS 3.2 Communications Server: IP Messages Volume 2 (EZB, EZD) in z/OS 3.2.

Chapter 1. IP message standards introduction

This topic contains the following information about IP message standards:

- “Message text formats” on page 1
- “Message description formats” on page 3
- “Message routing codes” on page 3
- “Message descriptor codes” on page 4
- “Message groups” on page 5

Message text formats

Most IP messages are preceded by an identifier, as illustrated in [Figure 1 on page 1](#).

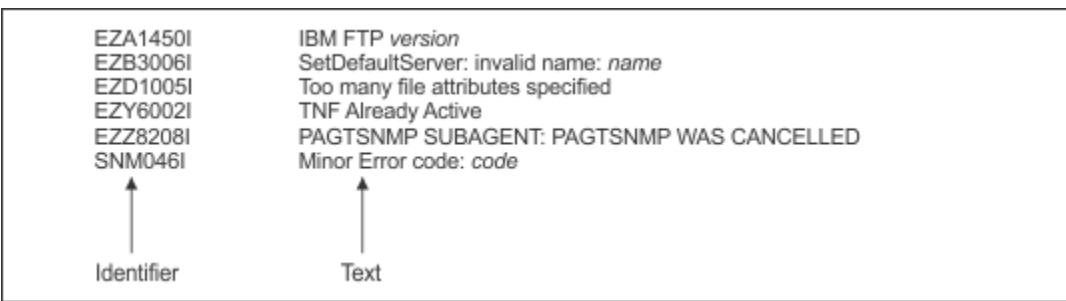

Figure 1. Sample IP message format

Message identifiers

All message identifiers include the following sections:

- Prefix
- Message number
- Message type code

See [Figure 2 on page 1](#) for a sample IP message identifier.

Figure 2. Sample IP message identifier

Prefix

Message identifiers include a prefix that identifies the source of the message. The following message prefixes are used by TCP/IP and its associated applications:

- EZA
- EZAIN

- EZAOP
- EZB
- EZBH
- EZD
- EZY
- EZYF
- EZYP
- EZYR
- EZYT
- EZYX
- EZZ
- SNM

Message number

Message identifiers include a unique 2- through 4-digit message number.

Message type code

The following type codes are used in IP messages:

A Action

The message indicates that an action is required.

E Eventual Action

You must eventually take some action to correct a problem. The system continues processing without waiting for a response.

I Information

The message is for your information. This type code can be used to notify you of an error. No response is necessary, but you might need to take some action.

S Severe Error

The message is for a system programmer.

W Wait

Processing stops until the operator takes a required action.

Syntax notation in message text

In this documentation, IP messages are described with the following syntax notation:

Non-highlighted characters

Represent the actual text of the message.

italic characters

Represent message variables. The variables are replaced by their values in the actual message.

Braces { }

Represent a group of text strings, only one of which is displayed in the actual message. The text strings are separated by or-signs (|) in the braces.

The braces and or-signs are not displayed in the actual message.

Brackets []

Represent optional messages or optional parts of a message. Optional messages or optional parts of a message are displayed only under certain circumstances that are described in the "Explanation" section of the message. If an optional part has more than one possible value, or-signs separate the possibilities.

The brackets and or-signs are not displayed in the actual message.

Message description formats

A message consists of several sections. Not all sections are used for each message. For messages that are issued as a group, the "Explanation" section of the first message usually contains a complete description of the other messages in the group.

Explanation

Explains why the message was issued and describes all text and variables in the message.

System action

Explains the system state after the message was issued. This section also indicates whether the system is waiting for a reply.

Operator response

Describes actions that the operator can or must take at the console.

System programmer response

Suggests actions, programming changes, or system definition changes that isolate or correct errors or improve the efficiency of the system.

User response

Describes actions that the user can or must take at the terminal.

Problem determination

Additional instructions for determining the cause of the problem, searching problem databases, and if necessary, reporting the problem to the IBM support center. These instructions are for system programmers who can troubleshoot problems.

Source

Element, product, or component that issued the message.

Module

Module or modules that issued the message.

Automation

Indicates whether the message is a candidate for automation.

Example

Example of the message with variable fields replaced with actual values, perhaps in context with other messages.

Message routing codes

Routing codes determine where a message is displayed. More than one routing code might be assigned to the message. With multiple-console support, each console operator receives the messages related only to the commands entered at that console or to the functions assigned to that console, regardless of the routing codes assigned to those messages. If a message that is routed to a particular console cannot be issued at that console, that message is issued at the master console.

The following routing codes are used in IP messages:

Code

Meaning

1

Master Console Action: This message indicates a change in the system status and demands action by the master console operator.

2

Master Console Information: This message indicates a change in the system status. Such a message does not demand action, but alerts the master console operator to a condition that might require action. This routing code is used for any message that indicates job status, and also for processor and problem program messages to the master console operator.

- 3 **Tape Pool:** This message specifies the status of a tape unit or reel, the disposition of a tape reel, or other tape-oriented information. For example, this can be a message which requests that tapes be mounted.
- 4 **Direct Access Pool:** This message specifies the status of a direct access unit or pack, the disposition of a disk pack, or other direct-access-oriented information. For example, this can be a message which requests that disks be mounted.
- 5 **Tape Library:** This message specifies the tape library information. For example, this can be a message which requests, by volume serial numbers, that tapes be obtained for system or programmer use.
- 6 **Disk Library:** This message specifies the disk library information. For example, this can be a message which requests, by volume serial numbers, that disk packs be obtained for system or programmer use.
- 7 **Unit Record Pool:** This message specifies the unit-record equipment information. For example, this can be a message which requests that printer trains be mounted.
- 8 **Teleprocessing Control:** This message specifies the status or the disposition of data communication equipment. For example, this can be a message that indicates line errors.
- 9 **System Security:** This message is associated with security checking. For example, this can be a message that requires a reply that is specifying a password.
- 10 **System Error Maintenance:** This message indicates either a system error, or an input/output error that cannot be corrected. It also indicates a message that is associated with system maintenance.
- 11 **Programmer Information:** This message is for the problem programmer. This routing code is used only when the program that issued the message cannot route the message to the programmer by using the system-output data set facility. The message is displayed in the system output message class of the job.
- 12 **Emulators:** This message is issued by an emulator program.
- 13 Reserved for customer use.
- 14 Reserved for customer use.
- 15 Reserved for customer use.
- 16 Reserved for future expansion.

Message descriptor codes

Descriptor codes describe the kind of message being issued. These codes, with message routing codes, determine how a message is to be printed or displayed and how a message is to be deleted from a display device. Descriptor codes 1 – 7 are mutually exclusive; only one such code is assigned to a message. Descriptor codes 8 – 10 can be displayed with any other descriptor codes.

The following descriptor codes are used in IP messages:

Code	Meaning
------	---------

- 1 **System Failure:** This message indicates that an error that cannot be corrected occurs. To continue, the operator must restart the system.
- 2 **Immediate Action Required:** This message requires an immediate action by the operator. The action is required because the message issuer is in a wait state until the action is taken, or because system performance is degraded until the action is taken.
- 3 **Eventual Action Required:** This message requires an eventual action by the operator. The task does not await completion of the action.
- 4 **System Status:** This message indicates the status of a system task or of a hardware unit.
- 5 **Immediate Command Response:** This message is issued as an immediate response to a system command. The completion of the response is not dependent on another system action or task.
- 6 **Job Status:** This message contains status information regarding the job or job step.
- 7 **Application Program/Processor:** This message is issued when a program is in problem mode.
- 8 **Out-of-Line Message:** This message is one of a group of messages to be displayed out of line. If the device support cannot print a message out of line, the code is ignored, and the message is printed in line with other messages.
- 9 **Request of the Operator:** This message is written in response to a request of the operator for information by the DEVSERV, MONITOR commands, and other operating system commands.
- 10 This message is issued in response to a **TRACK** command.
- 11 **Critical Eventual Action Required:** This message indicates that a critical event has occurred and must eventually be followed by an action. The message remains on the screen until the action is taken.
- 12 **Important Information:** This message contains important information that must be displayed at the console, but does not require any action in response.
- 13–16 Reserved.

Message groups

A message group contains two or more messages that are displayed together in response to a specific command or error condition. The following example is a message group.

```
EZZ8453I jobtype STORAGE
EZZ8454I jobname STORAGE      CURRENT MAXIMUM  LIMIT
EZD2018I location
EZZ8455I      storagetype current maximum limit
EZZ8459I DISPLAY TCPIP STOR COMPLETED SUCCESSFULLY
```

In most cases, the "Explanation" section of the first message in the group contains an example of the group and information about all messages in the group. The message descriptions of members of the group refer back to the first message for complete information.

Chapter 2. EZB0xxxx messages

EZB0600I *message*

Explanation

This message is received by the server when the dynamic allocation of a data set or the MVS enqueueing (ENQ) function was unsuccessful.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

S99Error

EZB0603I *offset*

Explanation

This message indicates the offset at which the data string buffer is initialized.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DumpString

EZB0606I *buffer position*

Explanation

This message indicates the position at which the data string buffer is initialized.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DumpString

EZB0611E Data Set name “arguments” invalid.

Explanation

An argument declared in the *hlq*.LPD.CONFIG data set is incorrect. This message indicates the incorrect argument as declared by the user.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the argument declared in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for information about the syntax rules for the *hlq*.LPD.CONFIG data set.

Module

LPD

Procedure name

ProcessOperands

EZB0612E Data Set “arguments” not found.

Explanation

The argument declared in the *hlq*.LPD.CONFIG data set was not found. This message indicates the argument as declared by the user.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the argument declared in the *hlq*.LPD.CONFIG data set and restart the program. See the [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessOperands

EZB0613E	Data Set “<i>dataset name</i>” does not contain member “<i>member name</i>”.
-----------------	---

Explanation

The data set name specified in the *data set name* parameter of the SEZAINST(LPSPROC) data set does not contain the indicated member.

System action

LPD ends.

Operator response

None.

System programmer response

Specify the correct data set name in the *data set name* parameter of the SEZAINST(LPSPROC) data set. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessOperands

EZB0614I	IBM MVS LPD version <i>version level</i>
-----------------	---

Explanation

This message indicates the current version and level of LPD for MVS.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

ProcessVersionOption

EZB0615I	The option " <i>option</i> " is ambiguous. Use a longer abbreviation.
----------	---

Explanation

An option specified in a parameter of the SEZAINST(LSPPROC) data set is incomplete. The option was abbreviated; however, the abbreviation is too short to distinguish between 2 correct options.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct option in the SEZAINST(LPSPROC) data set and restart the procedure. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessOptions

EZB0616I	The option "option" was not recognized.
----------	---

Explanation

An option specified in a parameter of the SEZAINST(LPSPROC) data set is not recognized.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct option parameter of the SEZAINST(LPSPROC) data set and verify that the option specified is supported on your system. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessOptions

EZB0617I	Use the TRACE, TYPE or VERSION options as needed.
-----------------	--

Explanation

An incorrect option was specified in a parameter of the SEZAINST(LPSPROC) data set. This message indicates the correct options for this parameter. The following list provides the names and descriptions for these options:

VERSION

Displays the version number.

TYPE

Activates high-level trace facility in the LPD server. Significant events, such as the receipt of a job for printing, are recorded in the SYSOUT data set specified in your LPSPROC data set.

TRACE

Causes a detailed trace of activities in the LPD server to record in the SYSOUT data set specified in your LPSPROC data set. The detailed tracing can also be activated by the DEBUG statement in the configuration data set (*hlq*.LPD.CONFIG) and by the TRACE command of the SMSG interface.

System action

LPD continues.

Operator response

None.

System programmer response

Enter the correct option and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessOptions

EZB0619I	Data set prefix not specified
-----------------	--------------------------------------

Explanation

The prefix name of the TRACE *name* parameter of the SEZAINST(LPSPROC) data set was not specified. The parameter specifies the prefix of the configuration data set. The default is *hlq*. for the LPD.CONFIG data set.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct data set prefix in the PREFIX *name* parameter of the SEZAINST(LPSPROC) data set. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessOptions

EZB0620I	Program error: Invalid option <i>rc</i>
-----------------	--

Explanation

An error has occurred during processing of the configuration data set. This message indicates the return code received for this procedure.

System action

The program ends abnormally.

Operator response

None.

System programmer response

Verify that the correct option parameters have been declared in the SEZAINST(LPSPROC) data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information. If the error persists, contact the IBM Software Support Center.

Module

LPD

Procedure name

ProcessOptions

EZB0621I	LPD starting with port <i>port number</i>
-----------------	--

Explanation

This message indicates the port number on which the LPD connection was initiated.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

ProcessArguments

EZB0622E	<i>message</i>
-----------------	----------------

Explanation

The LPD is shutting down. See the text of the message for further explanation.

System action

LPD ends.

Operator response

None.

System programmer response

Check the message content for an indication of configuration problems. Reinitiate TCPIP, if required.

Module

LPD

Procedure name

Restore.

EZB0624I	<i>reason</i>
-----------------	---------------

Explanation

The restore procedure, which resets the line printer daemon (LPD) counters to the default values and performs a cleanup routine, was initiated and LPD is ending. This message describes the reason for the procedure call and is not always an indication of a problem.

In the message text:

reason

The reason for the procedure call.

System action

LPD ends.

Operator response

Contact the system programmer if the message indicates a problem.

System programmer response

If this message indicates a problem, check for other messages in the LPD log that precede this one, such as EZB0622E and EZB0623I. Use the information from these other messages to determine what action to take and restart LPD.

User response

Descriptor code

Not applicable.

Example

Not applicable.

EZB0623I

errmsg (msgnum)

Explanation

This message indicates the return code received by the Restore procedure. This procedure initiates a cleanup routine and ends TCPIP processing. This message is displayed with EZB0622I.

errmsg is the text of the message that describes the error.

msgnum is the 4-digit numeric portion of the message identifier of the **EZA** message whose text is displayed in *errmsg*. For more information about this message, see message *EZAmsgnum* in the [z/OS Communications Server: IP Messages Volume 1 \(EZA\)](#).

System action

LPD ends.

Operator response

None.

System programmer response

Respond as indicated by the message *EZAmsgnum*.

Module

LPD

Procedure name

Restore

EZB0625E**Out of storage for connections!**

Explanation

There is not enough storage allocated for a connection to complete.

System action

The program ends abnormally.

Operator response

None.

System programmer response

Allocate more storage for connections.

Module

LPD

Procedure name

AllocConnection

EZB0626I**Allocated ConnectionBlock at *address***

Explanation

A connection block was allocated at the indicated IP address. A connection block is used to build a connection record.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

AllocConnection

EZB0627I**Passive open on port *port number*****Explanation**

A passive connection opening was established on the indicated port number.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

GetNewConnection

EZB0628I**Allocated PrinterBlock at *address*****Explanation**

A printer block was allocated at the indicated IP address.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

AllocPrinter

EZB0629I	<i>printer name added.</i>
Explanation	
This message indicates the name of the printer that was allocated for the LPD server.	
System action	
LPD continues.	
Operator response	
None.	
System programmer response	
None.	
Module	
LPD	
Procedure name	
AllocPrinter	
EZB0630I	<i>Spool allocate RC rc, Class default class, DEST NJEdest, ID NJE ID, OUTPUT default spool</i>
EZB0631I	<i>string</i>
Explanation	
The Network Job Entry system (NJE) is being used as the remote printing application for LPD. This message indicates the SYSOUT class, the name of the NJE node, the device user ID, the output name, and the value of the data buffer.	
System action	
LPD continues.	
Operator response	
None.	
System programmer response	
None.	
Module	
LPD	
Procedure name	
CompletePrinter	
EZB0632I	<i>string</i>

Explanation

This message indicates the size of the data buffer.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

CompletePrinter

EZB0633I	Use DEST and IDENTIFIER for MVS.
-----------------	---

Explanation

The DEST and IDENTIFIER parameters should be used for this MVS system. The DEST option sets the destination node. The default is the local node. The IDENTIFIER option specifies the device user ID. The default is SYSTEM.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

CompletePrinter

EZB0635I	Spool allocate RC <i>spool rc</i>, Class <i>default class</i>, OUTPUT <i>default spool</i>
EZB0636I	<i>string</i>

Explanation

The Network Job Entry system (NJE) is being used as the remote printing application for LPD. This message indicates the SYSOUT class, the name of the NJE node, the device user ID, the output name, and the value of the data buffer.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

CompletePrinter

EZB0637I *string*

Explanation

This message indicates the size of the data buffer.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

CompletePrinter

EZB0640I *The errors reported above prevent startup of dataset name*

Explanation

The indicated data set name could not be opened. See the previous messages, which provide more specific information about this error.

System action

LPD continues.

Operator response

None.

System programmer response

This message is displayed with more specific error messages. Respond as indicated by the previous messages.

Module

LPD

Procedure name

CompletePrinter

EZB0641I

Service printer name defined with address *address*

Explanation

This message indicates the service name and the address space that were declared in the *name* parameter of the SERVICE statement of the *hlq*.LPD.CONFIG data set. The *name* parameter specifies a service where connections are accepted and acknowledged.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

CompletePrinter

EZB0642I

Use a class which is one letter.

Explanation

The CLASS=*class* parameter of the service defined in the SERVICE statement of the *hlq*.LPD.CONFIG data set is incorrect. This parameter specifies the SYSOUT class. The default is A for printers and B for punches.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct class in the CLASS=*class* parameter and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRSCSDefault

EZB0643I	Use a class which is one letter or digit.
-----------------	--

Explanation

The CLASS=*class* parameter of the service defined in the SERVICE statement of the *hlq*.LPD.CONFIG data set is incorrect. This parameter specifies the SYSOUT class. The default is A for printers and B for punches.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct class in the CLASS=*class* parameter and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRSCSDefault

EZB0644I	Use a number after the PRIORITY keyword.
-----------------	---

Explanation

An unexpected character was received after the PRIORITY=*priority* parameter of the service defined in the SERVICE statement of the *hlq*.LPD.CONFIG data set. The PRIORITY parameter specifies the transmission priority. The default is 50.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the entry declared in the `PRIORITY=priority` parameter and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRCSCDefault

EZB0645I**SPOOL only valid for PRINTER or PUNCH**

Explanation

SPOOL is valid for the PRINTER or PUNCH services only. These services are specified in the SERVICE statement of the *hlq*.LPD.CONFIG data set.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the parameters declared for the services specified in the SERVICE statement. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRSCSDefault

EZB0646I**Could not spool *dataset name device*. Return code *rc***

Explanation

The attempt to spool to the data set defined in the *name* parameter of the SERVICE statement was unsuccessful. This message indicates the return code received after this procedure.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct data set name specified in the *name* parameter of the SERVICE statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRSCSDefault

EZB0647I	Only use CLASS, DEST, IDENTIFIER, OTHERS, PRIORITY, SPOOL or TAG as qualifiers.
-----------------	--

Explanation

An incorrect parameter was specified in the RSCS statement of the *hlq*.LPD.CONFIG data set. The following list provides a description for these parameters:

CLASS

The SYSOUT class. The default is A for printers and B for punches.

DEST

Specifies the destination node ID. The default is the node on which LPSERVE is running.

IDENTIFIER

Specifies the device user ID. The default is SYSTEM.

OTHERS

The option is ignored by MVS LPSERVE.

PRIORITY

Specifies the transmission priority. The default is 50.

SPOOL

Supplies the operands for the CP SPOOL command that will be used on the virtual printer or punch that is defined for each new job.

TAG

Supplies the operands for the CP TAG command that will be used on the virtual printer or punch that is defined for each new job.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct parameter in the RSCS statement of the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRSCSDefault

EZB0648I**Use a class which is one letter.****Explanation**

The CLASS option of the NJE parameter for the SERVICE statement in the *hlq*.LPD.CONFIG data set is not correct. The default is A for printers and B for punches.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct CLASS option for the NJE parameter in the SERVICE statement and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRSCSDefault

EZB0649I**Use a class which is one letter or digit.****Explanation**

The CLASS option of the NJE parameter for the SERVICE statement in the *hlq*.LPD.CONFIG data set is not correct. The default is A for printers and B for punches.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct CLASS option for the NJE parameter in the SERVICE statement and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRSCSDefault

EZB0650I**SPOOL only valid for PRINTER or PUNCH****Explanation**

SPOOL is valid for the PRINTER or PUNCH services only. These services are specified in the SERVICE statement of the *hlq*.LPD.CONFIG data set.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the parameters declared for the services specified in the SERVICE statement. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRSCSDefault

EZB0651I**Could not spool *dataset name device*. Return code *rc*****Explanation**

The attempt to spool to the data set defined in the *name* parameter of the SERVICE statement was unsuccessful. This message indicates the return code received after this procedure.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct data set name specified in the *name* parameter of the SERVICE statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRSCSDefault

EZB0652I**Only use CLASS, DEST, SPOOL or TAG as qualifiers.**

Explanation

An incorrect parameter was specified in the LOCAL statement of the *hlq*.LPD.CONFIG data set. The following list provides a description for these parameters:

CLASS

The SYSOUT class. The default is A for printers and B for punches.

DEST

Specifies the destination node ID. The default is the node on which LPSERVE is running.

SPOOL

Supplies the operands for the CP SPOOL command that will be used on the virtual printer or punch that is defined for each new job.

TAG

Supplies the operands for the CP TAG command that will be used on the virtual printer or punch that is defined for each new job.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct parameter in the RSCS statement of the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

SetPrinterRSCSDefault

EZB0653I

The keyword “*keyword*” is not a keyword.

Explanation

An incorrect parameter was declared in the SMTP statement of the *hlq*.LPD.CONFIG data set. The SMTP statement specifies the SMTP server name, CLASS, and DEST options.

System action

LPD continues. Failed job will not work unless the SMTP statement is defined and LPD is restarted.

Operator response

None.

System programmer response

Correct the parameter declared in the SMTP statement of the *hlq*.LPD.CONFIG data set, and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessSMTPOptions

EZB0654I

The keyword “*keyword*” is too short. Use a longer abbreviation.

Explanation

The indicated option was abbreviated. However, the abbreviation is too short to distinguish between 2 correct options.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct option and restart the procedure. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessLocalandRCSCOptions

EZB0655I

Use the SMTP service machine name after “SMTP”.

Explanation

An incorrect parameter was specified in the SMTP statement of the *hlq*.LPD.CONFIG data set. This statement specifies the SMTP server name, CLASS, and DEST options.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct name in the *server_name* parameter of the SMTP statement of the *hlq*.LPD.CONFIG data set and restart the program. If this parameter is omitted, the default is SMTP. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessSMTPOptions

EZB0656I

The keyword “*keyword*” is not a keyword.

Explanation

An incorrect parameter was declared in the SMTP statement of the *hlq*.LPD.CONFIG data set. The SMTP statement specifies the SMTP server name, CLASS, and DEST options.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the parameter declared in the SMTP statement of the *hlq*.LPD.CONFIG data set, and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessSMTPOptions

EZB0657I

The keyword “*keyword*” is too short. Use a longer abbreviation.

Explanation

A parameter of the SMTP statement in the *hlq*.LPD.CONFIG data set is incorrect. This parameter was abbreviated; however, the abbreviation is too short to distinguish between two correct parameters.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct parameter in the SMTP statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessSMTPOptions

EZB0658I

Use a class which is one letter.

Explanation

The class specified in the CLASS=*class* parameter of the SMTP statement of the *hlq*.LPD.CONFIG data set is incorrect. This parameter specifies the SYSOUT class. The default is A for printers and B for punches. Valid values for this parameter are A through Z.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the class declared in the CLASS=*class* parameter of the SMTP statement in the *hlq*.LPD.CONFIG data set and restart the program.

Module

LPD

Procedure name

ProcessSMTPOptions

EZB0659I

Use a class which is one letter or digit.

Explanation

The class specified in the CLASS=*class* parameter of the SMTP statement of the *hlq*.LPD.CONFIG data set is incorrect. This parameter specifies the SYSOUT class. The default is A for printers and B for punches. Valid values for this parameter are A through Z and 0 through 9.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the class declared in the CLASS=*class* parameter of the SMTP statement in the *hlq*.LPD.CONFIG data set and restart the program.

Module

LPD

Procedure name

ProcessSMTPOptions

EZB0660I

Only use CLASS, DEST, IDENTIFIER or OTHERS as qualifiers.

Explanation

A parameter of the SMTP statement in the *hlq*.LPD.CONFIG data set is incorrect. This message indicates the correct parameters for this statement.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct parameter for the SMTP statement of the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

ProcessSMTPOptions

EZB0665I

Cannot open configuration file.

Explanation

The configuration data set could not be opened.

System action

LPD ends.

Operator response

None.

System programmer response

Verify that the name of the configuration data set was specified correctly. Verify that the data set is available to the server. Verify that the server has authority to access the data set.

Module

LPD

Procedure name

PreparePrinters

EZB0666I

Use *option* after you have defined a SERVICE.

Explanation

A parameter of the SERVICE statement in the *hlq*.LPD.CONFIG data set was not found. The SERVICE statement specifies a service for which connections are accepted and acknowledged. The following provides a description of the valid parameters for the SERVICE statement:

name

The service name must be one to eight characters in length. Only characters permitted in MVS data set names are valid. This value is case-sensitive.

PRINTER

Specifies that the service is to a printer.

PUNCH

Specifies that the service is to a punch device.

NONE

Specifies that the service is not currently in use.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct parameter for in the SERVICE statement of the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0667I

The keyword “keyword” is ambiguous. Use a longer abbreviation.

Explanation

A statement of the *hlq*.LPD.CONFIG data set is incorrect. An abbreviation was used for this statement; however, the abbreviation is too short to distinguish between two correct statements.

System action

LPD continues.

Operator response

None.

System programmer response

Use the correct statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0668I

The keyword “keyword” was not recognized.

Explanation

A statement in the *hlq*.LPD.CONFIG data set is incorrect.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the statement in the *hlq*.LPD.CONFIG data set and restart the job. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0669I

Use an integer after “DISK or UNIT”.

Explanation

A number is expected after the DISK or UNIT statements of the *hlq*.LPD.CONFIG data set.

System action

LPD halts.

Operator response

None.

System programmer response

Specify the correct value in the parameters of the DISK or UNIT statement of the *hlq*.LPD.CONFIG data set and restart the program.

Module

LPD

Procedure name

PreparePrinters

EZB0670I**Use either START or END after "EXIT".**

Explanation

Specify the START or END parameter with the EXIT statement of the *hlq*.LPD.CONFIG data set. The following provides a description for these parameters:

Parameter	Description
START	Specifies that the program is invoked after allocating and opening the output data set, but before anything is written to the data set.
END	Specifies that the program is invoked just before closing the output data set.

System action

LPD continues.

Operator response

None.

System programmer response

Use the correct parameter with the EXIT statement of the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0671I**Use either START or END after "EXIT".**

Explanation

An incorrect parameter was specified in the EXIT statement of the *hlq*.LPD.CONFIG data set. The following provides a description for these parameters:

Parameter	Description
START	Specifies that the program is invoked after allocating and opening the output data set, but before anything is written to the data set.
END	Specifies that the program is invoked just before closing the output data set.

System action

LPD continues.

Operator response

None.

System programmer response

Use the correct parameter with the EXIT statement of the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0672I	Use name after type of EXIT.
-----------------	-------------------------------------

Explanation

The program name specified in the *program* parameter of the EXIT statement in the *hlq*.LPD.CONFIG data set is incorrect or not found. This parameter specifies the name of the program to be invoked after allocating and opening, but before closing, an output data set.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct program name in the *program* parameter of the EXIT statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0673I	Could not load EXIT <i>program name</i>.
-----------------	---

Explanation

The program name specified in the *program* parameter of the EXIT statement in the *hlq*.LPD.CONFIG data set could not be accessed. This parameter specifies the name of the program to be invoked after allocating and opening, but before closing, an output data set. This message is displayed when the START parameter was specified with the EXIT statement.

System action

LPD continues.

Operator response

None.

System programmer response

Verify that the correct program name was specified in the *program* parameter of the EXIT statement in the *hlq*.LPD.CONFIG data set and restart the program.

The library containing the program should be in the system's link list, (LNKLSTxx) or a STEPLIB definition can be used if the library is APF authorized.

Module

LPD

Procedure name

PreparePrinters

EZB0674I Could not load EXIT *program name*.

Explanation

The program name specified in the *program* parameter of the EXIT statement in the *hlq*.LPD.CONFIG data set could not be accessed. This parameter specifies the name of the program to be invoked after allocating and opening, but before closing, an output data set. This message is displayed when the END parameter was specified with the EXIT statement.

System action

LPD continues.

Operator response

None.

System programmer response

Verify that the correct program name was specified in the *program* parameter of the EXIT statement in the *hlq*.LPD.CONFIG data set and restart the program.

The library containing the program should be in the system's link list, (LNKLSTxx) or a STEPLIB definition can be used if the library is APF authorized.

Module

LPD

Procedure name

PreparePrinters

EZB0675I Use either MAIL or DISCARD after "FAILEDJOB".

Explanation

A parameter specified in the FAILEDJOB statement of the *hlq*.LPD.CONFIG data is incorrect or not found. This statement specifies whether a notice of unsuccessful jobs should be mailed to users or a job is discarded without notification. The following provides a description for these parameters:

MAIL

Specifies that notices of unsuccessful jobs are mailed to users.

DISCARD

Specifies that unsuccessful jobs are discarded without notice.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct parameter in the FAILEDJOB statement of the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0676I**Use an integer after “LINESIZE”.****Explanation**

The value specified in the *length* parameter of the LINESIZE statement in the *hlq*.LPD.CONFIG data set was not found. This parameter specifies the number of characters in a line on a page. Lines longer than this number are truncated. The default is 132.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the value declared in the *length* parameter of the LINESIZE statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0677I**Use an integer after “LINESIZE”**

Explanation

The value specified in the *length* parameter of the LINESIZE statement in the *hlq*.LPD.CONFIG data set is incorrect. This parameter specifies the number of characters in a line on a page. Lines longer than this number are truncated. The default is 132.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the value declared in the *length* parameter of the LINESIZE statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0678I

Use only one of LOCAL, NJE, RSCS, and REMOTE.

Explanation

The destination type parameter for the SERVICE statement in the *hlq*.LPD.CONFIG data set is not correct. The following list provides a description of the valid destination types for this parameter:

LOCAL

Specifies that the data sets are written to the local MVS printer or punch.

NJE

Specifies that the data sets are delivered to the Network Job Entry (NJE) system.

RSCS

Specifies that the data sets are delivered to the Remote Spooling Communications Subsystem (RSCS).

REMOTE

Specifies that the data sets are forwarded to a remote printer.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the destination type parameter for the SERVICE statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0679I**Allocated ObeyBlock at *address***

Explanation

The OBEY statement for the *hlq*.LPD.CONFIG data set has been received. This statement specifies user IDs authorized to use the SMSG interface provided with LPD. This message indicates that an address has been allocated an ObeyBlock, or authorization to use the SMSG interface. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

PreparePrinters

EZB0680I**Use an integer after “PAGESIZE”.**

Explanation

The value specified in the *lines* parameter of the PAGESIZE statement in the *hlq*.LPD.CONFIG data set was not found. This parameter specifies the number of lines on a page. The default is 60.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct value in the *lines* parameter of the PAGESIZE statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0681I

Use an integer after “PAGESIZE”.

Explanation

The value specified in the *lines* parameter of the PAGESIZE statement in the *hlq*.LPD.CONFIG data set is incorrect. This parameter specifies the number of lines on a page. The default is 60.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct value in the *lines* parameter of the PAGESIZE statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0682I

Use a *printer@hostname* after “REMOTE”.

Explanation

The destination specified in the *printer@hostname* parameter of the REMOTE statement in the *hlq*.LPD.CONFIG data set was not found. This parameter indicates the destination printer at a specified IP host. This can be an IP name or an IP address.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct entry in the *printer@hostname* parameter of the REMOTE statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0683I

Use a *printer@hostname* after “REMOTE”.

Explanation

The destination specified in the *printer@hostname* parameter of the REMOTE statement in the *hlq*.LPD.CONFIG data set is incorrect. This parameter indicates the destination printer at a specified IP host. This can be an IP name or an IP address.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct entry in the *printer@hostname* parameter of the REMOTE statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0684I

Cannot reach *destination*

Explanation

The destination specified in the *printer@hostname* parameter of the REMOTE statement in the *hlq*.LPD.CONFIG data set could not be reached. This parameter indicates the destination printer at a specified IP host. This can be an IP name or an IP address.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct destination in the *printer@hostname* parameter of the REMOTE statement, and for the correct service name specified in the *name* parameter of the SERVICE statement in the *hlq*.LPD.CONFIG

data set, and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0685I

Use only one of LOCAL, NJE, RSCS, and REMOTE.

Explanation

The destination type parameter specified for the SERVICE statement in the *hlq*.LPD.CONFIG data set is not correct. The following list provides a description of the valid service names for this parameter:

LOCAL

Specifies that the data sets are written to the local MVS printer or punch.

NJE

Specifies that the data sets are delivered to the Network Job Entry (NJE) system.

RSCS

Specifies that the data sets are delivered to the Remote Spooling Communications Subsystem (RSCS).

REMOTE

Specifies that the data sets are forwarded to a remote printer.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the destination type parameter declared for the SERVICE statement in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0686I

Host “*host*” resolved to *address*. Printer name is “*printer name*”.

Explanation

This message indicates the host name, IP address, and the printer name to which the destination address was resolved. The destination address is specified in the *printer@hostname* parameter of the REMOTE statement in the *hlq*.LPD.CONFIG data set.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

PreparePrinters

EZB0687I Use only one of LOCAL, NJE, RSCS, and REMOTE.

Explanation

The service name specified in the *name* parameter of the SERVICE statement in the *hlq*.LPD.CONFIG data set is incorrect. The following list provides a description of the valid service names for this parameter:

LOCAL

Specifies that the data sets are written to the local MVS printer or punch.

NJE

Specifies that the data sets are delivered to the Network Job Entry (NJE) system.

RSCS

Specifies that the data sets are delivered to the Remote Spooling Communications Subsystem (RSCS).

REMOTE

Specifies that the data sets are forwarded to a remote printer.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the service name declared in the *name* parameter of the SERVICE parameter in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0688I Use a printer name and type after “SERVICE”.

Explanation

The service name specified in the *name* parameter of the SERVICE statement in the *hlq*.LPD.CONFIG data set was not found. The SERVICE statement specifies the service name for which connections are accepted and acknowledged.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct name specified in the *name* parameter of the SERVICE statement and restart the program. See z/OS Communications Server: IP Configuration Reference for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0689I	The service “<i>service name</i>” has been described more than once.
-----------------	---

Explanation

The service name specified in the *name* parameter of the SERVICE statement in the *hlq*.LPD.CONFIG data set is a duplicate. This statement specifies a service for which connections are accepted and acknowledged.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct name specified in the *name* parameter of the SERVICE statement and restart the program.
See z/OS Communications Server: IP Configuration Reference for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0690I Use a printer name and type after "SERVICE".

Explanation

The service name specified in the *name* parameter of the SERVICE statement in the *hlq*.LPD.CONFIG data set was not found. This statement specifies a service for which connections are accepted and acknowledged.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct name specified in the *name* parameter of the SERVICE statement and restart the program.

Module

LPD

Procedure name

PreparePrinters

EZB0691I**Use “PRINTER” or “PUNCH” as a SERVICE type.**

Explanation

The parameter specified in the SERVICE statement of the *hlq*.LPD.CONFIG data set is incorrect. This statement indicates a service for which connections are accepted and acknowledged. The following provides a description of the valid parameters for this statement:

name

The service name must be one to eight characters in length. Only characters permitted in MVS data set names are valid. This value is case-sensitive.

PRINTER

Specifies that the service is to a printer.

PUNCH

Specifies that the service is to a punch device.

NONE

Specifies that the service is not currently in use.

System action

LPD continues.

Operator response

None.

System programmer response

Verify that the correct parameter is specified in the SERVICE statement and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters.

EZB0692I**Use a Volume Serial after "VOLUME".**

Explanation

An incorrect value was declared in the VOLUME statement of the *hlq*.LPD.CONFIG data set.

System action

LPD continues.

Operator response

None.

System programmer response

Check for the correct entry specified in the VOLUME statement of the *hlq*.LPD.CONFIG data set and restart the program. The correct length of this parameter is six characters.

Module

LPD

Procedure name

PreparePrinters

EZB0693I**Use a Table Name after "TRANSLATETABLE".**

Explanation

The name specified in the *name* parameter of the TRANSLATETABLE statement in the *hlq*.LPD.CONFIG data set was not found. This parameter specifies the name of the translation table. If a DBCS conversion parameter is specified, *name* is used to determine which DBCS table to load.

System action

LPD continues.

Operator response

None.

System programmer response

Verify that the correct name was specified in the *name* parameter of the TRANSLATETABLE statement and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0694I**Could not load Translate Table.**

Explanation

The translation table name specified in the *name* parameter of the TRANSLATETABLE statement in the *hlq*.LPD.CONFIG data set could not be loaded. This statement specifies the translation table to be used by the client and is found in the *name*.TCPXLBIN data set.

System action

LPD continues.

Operator response

None.

System programmer response

Verify that the correct translate table name is specified in the *name* parameter of the TRANSLATETABLE statement, verify that the *name*.TCPXLBIN data set is available to the server, and restart the program. If a DBCS conversion parameter is specified in the SMTP.SMTP.CONFIG data set, *name* is used to determine which DBCS translation table to load.

Module

LPD

Procedure name

PreparePrinters

EZB0695I**Could not load translate table with name - *name* for printer
*printer_name***

Explanation

The Line Printer Daemon (LPD) attempted to load an SBCS translation table corresponding to the name provided by the TRANSLATETABLE or XLATETABLE statement in the *hlq*.LPD.CONFIG data set. This statement specifies the translation table to be used by the remote client for SBCS ASCII to EBCDIC translations.

All data sets in the search order hierarchy for the required translate table data set either do not exist, or do not contain data in the required format for SBCS binary translate tables.

name is an input string that becomes part of the translation table data set name (for example, *hlq.name*.TCPXBLIN).

printer_name is the name of the printer service.

System action

LPD continues, however the printer service is unavailable.

Operator response

Notify the system programmer.

System programmer response

Configure a valid SBCS binary translate table data set in the search order hierarchy for the required SBCS translation table. See the [z/OS Communications Server: IP Configuration Reference](#) for more information about using translation tables including search order hierarchy and customization.

Module

LPD

Procedure name

PreparePrinters

EZB0696I	Program error: Invalid option <i>option</i>
-----------------	--

Explanation

An incorrect statement was specified in the *hlq*.LPD.CONFIG data set. This message indicates the statement as declared in this data set.

System action

TCPIP ends.

Operator response

None.

System programmer response

Restart TCPIP, correct the statement specified in the *hlq*.LPD.CONFIG data set and restart the program. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

PreparePrinters

EZB0697I	...End of Printer chain...

LoadPrinterQueue

EZB0737I**Reloading *dataset name* queue****Explanation**

LPD issues this message while tracing is on. While attempting to queue the previous data set name, an error was detected. The data set name is reloaded into the list of queued data sets.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

LoadPrinterQueue

EZB0738I**Ignoring *job number* from site *name* because there is no **SITE** file.**

Explanation

TCPIP was unable to locate the site for the specified job number.

System action

LPD continues.

Operator response

None.

System programmer response

Make sure the site was defined using the MAKESITE command.

Module

LPD

Procedure name

LoadPrinterQueue

EZB0739I**Validating user *user***

Explanation

This message occurs while tracing is on. The userid of the submitter of the print job is validated.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

LoadPrinterQueue

EZB0740I**Validation failed. RC *rc***

Explanation

TCPIP issues this message while tracing is on. While attempting to validate the password for the currently queued job an error was detected.

System action

LPD continues.

Operator response

Inform the system programmer of the error.

System programmer response

Assist the user as necessary.

Module

LPD

Procedure name

ValidateJob

EZB0744I *address punch line*

Explanation

LPD displays the address of the punch command text and the punch line number. The punch line text represents the information sent to SMTP from LPD.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

Punchline

EZB0747E **Could not allocate SMTP Spool**

Explanation

The SMTP device could not allocate the spool for the batch data set submitted using the SMTP command.

System action

LPD continues.

Operator response

Notify the system programmer.

System programmer response

Make sure the SMTP device is activated.

Module

LPD

Procedure name

SendFailingMail

EZB0748E**Could not open spool to *SMTP*. Return code was *last error***

Explanation

LPD could not spool a job to the indicated SMTP service. A nonzero return code was returned.

System action

LPD continues.

Operator response

Notify the system programmer.

System programmer response

Make sure the SMTP statement is updated to include accurate information for its parameters in the *hlq*.LPD.CONFIG data set. Also make sure that the MAIL parameter is used with the FAILEDJOB statement. For more information about the SMTP and FAILEDJOB statements, see [z/OS Communications Server: IP Configuration Reference](#). Check the return code issued in this message and the return codes listed under SMTP in the [z/OS Communications Server: IP and SNA Codes](#) to further determine and correct the error.

Module

LPR

Procedure name

SendFailingMail

EZB0750E**Could not deallocate Spool File *ddname* Error code was *rc***

Explanation

The SMTP server was unable to deallocate the specified spool file after attempting to close the SMTP connection.

System action

LPD continues.

Operator response

Notify the system programmer.

System programmer response

Check the return code issued in this message and the return codes listed under SMTP in the [z/OS Communications Server: IP and SNA Codes](#) to determine and correct the error.

Module

LPR

Procedure name

SendFailingMail

EZB0751I**Released StepBlock at *address***

Explanation

The SMTP server displays this message as the job at the specified address is deleted from storage.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

RemoveJobFiles

EZB0753I**New subcommand *command* (no operands)**

Explanation

This message is displayed while tracing is on. A new SMTP subcommand was detected by LPD with no optional operands.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

DoNewSubcommand

EZB0754I	New subcommand <i>command</i> operands <i>operands</i>.
-----------------	--

Explanation

This message is displayed while tracing is on. A new SMTP subcommand was detected by LPD. The new subcommand and optional operands are displayed.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

DoNewSubcommand

EZB0755I	Released StepBlock at <i>address</i>
-----------------	---

Explanation

This message occurs while tracing is on. This message is displayed when the previous subcommand is deleted from the stated storage area.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

DoNewSubcommand

EZB0756I

Job number *number* is invalid.

Explanation

The LPD server was unable to queue the specified job number for processing. The connection was terminated.

System action

LPD continues.

Operator response

Resubmit the job using the LPR command.

System programmer response

Assist the user as necessary.

Module

LPD

Procedure name

DoNewSubcommand

EZB0757I

Duplicate file name "*dataset name*".

Explanation

This message indicates that the specified data set was previously recognized by LPD. The job is ignored and the next job is processed.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoNewSubcommand

EZB0759E**Failed to allocate block for *jobnumber* from *site*****Explanation**

The service machine was unable to allocate enough storage to process the specified job at the specified site.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoNewSubCommand

EZB0760E**Failed to open “*dataset name*”.****Explanation**

The server machine's attempt to open the stated data set failed. The connection is terminated.

System action

LPD continues.

Operator response

Notify the system programmer.

System programmer response

Check for preceding error message EZB0600I in the LPD log to see why the open failed.

Module

LPD

Procedure name

DoNewSubcommand

EZB0761E**Could not open data file “*dataset name*”. Job abandoned.**

Explanation

The server machine issues this message after attempting to open the data file at the specified site with the specified file type. The job is abandoned.

System action

LPD continues.

Operator response

Notify the system programmer.

System programmer response

Make sure the specified site is defined by the MAKESITE command.

Module

LPR

Procedure name

DoSendStep

EZB0762I	Sending subcommand <i>command</i> with an operand of <i>operand</i>
-----------------	--

Explanation

LPD issues this message while tracing is on. LPD acknowledges sending the indicated subcommand with the indicated operand.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

DoSendJob

EZB0763I Closing connection *connection*

Explanation

This message is issued while tracing is on. The connection between the client and the LPD server has been closed.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoCloseConnection

EZB0764I	ACK received on connection <i>connection</i> for job <i>jobnumber</i> in state <i>jobstate</i>
-----------------	---

Explanation

This message is issued while tracing is on. LPD has received an acknowledgment of the specified connection. The current state of the job is also displayed.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoNewAck

EZB0765I	ACK in unexpected job state <i>jobstate</i>
-----------------	--

Explanation

This message is issued while tracing is on. LPD received an ACK from the remote host, but the job state was bad. See message EZB0764I for job and connection number.

System action

LPD continues.

Operator response

Check all physical ports and power switch to verify that the printer is ready for printing. If the problem persists, contact your hardware support personnel.

System programmer response

None.

Module

LPD

Procedure name

DoNewAck

EZB0766I **NACK has value *number***

Explanation

This message is issued while tracing is on. The remote host refused to complete processing for this job.

System action

LPD continues.

Operator response

Check the printer and make sure it is active. If the problem persists, contact your hardware support personnel.

System programmer response

None.

Module

LPD

Procedure name

DoNewAck

EZB0767I **Timer cleared for connection *connection***

Explanation

This message is issued while tracing is on. LPD has successfully cleared the timer for the specified connection.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoNewData

EZB0768I Ignoring Data delivered on connection *connection*

Explanation

This message is issued while tracing is on. The buffer has been exhausted. The data to be delivered is ignored.

System action

LPD continues.

Operator response

Notify the system programmer.

System programmer response

Increase the specified buffer size using the DATABUFFERPOOLSIZE statement.

Module

LPD

Procedure name

DoNewData

EZB0769I Job *jobnumber* removed from work queue

Explanation

This message is issued while tracing is on. LPD issues this message when the specified job number is removed from the list of queued jobs.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

RemoveJobWork

EZB0770I

Job *jobnumber* not found in printer chain.

Explanation

LPD issues this message when the specified job number is not found in the print queue.

System action

LPD halts.

Operator response

Notify the system programmer.

System programmer response

Check the LPD trace. Job may have already printed. Restart LPD.

Module

LPD

Procedure name

RemoveJobPrinter

EZB0771I

Released JobBlock at *address*

Explanation

LPD issues this message while tracing is on. The storage space allocated for the job block at the specified address was released.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

FreeJob

EZB0772I**End Connection *connection* for *errmsg (msgnum)***

Explanation

The specified LPD server connection has ended.

errmsg is the text of the message that describes the error.

msgnum is the 4–digit numeric portion of the message identifier of the **EZA** message whose text is displayed in *errmsg*. For more information about this message, see message EZA*msgnum* in the [z/OS Communications Server: IP Messages Volume 1 \(EZA\)](#).

System action

LPD continues.

Operator response

None.

System programmer response

Respond as indicated by the message EZA*msgnum*.

Module

LPD

Procedure name

DoEndConnection

EZB0773I**Connection *connection* terminated for *errmsg (msgnum)***

Explanation

This message indicates that the specified connection has been terminated.

errmsg is the text of the message that describes the error.

msgnum is the 4–digit numeric portion of the message identifier of the **EZA** message whose text is displayed in *errmsg*. For more information about this message, see message EZA*msgnum* in the [z/OS Communications Server: IP Messages Volume 1 \(EZA\)](#).

System action

LPD continues.

Operator response

None.

System programmer response

Respond as indicated by the message EZA*msgnum*.

Module

LPD

Procedure name

DoEndConnection

EZB0774I

Connection ended abruptly.

Explanation

The LPD connection with the remote printer has terminated. LPD received a job and the connection state was not CONNCLOSING.

System action

LPD continues.

Operator response

None.

System programmer response

Review the trace and restart the job. If DEBUG is not on, define DEBUG in the LPD.CONFIG and restart the job.

Module

LPD

Procedure name

DoEndConnection

EZB0775I

Released StepBlock at *address*

Explanation

This message is issued while tracing is on. The block at the specified address was freed of storage.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoEndConnection

EZB0776I**Released StepBlock at *address*****Explanation**

This message is issued while tracing is on. The storage space specified was released because there were no jobs awaiting processing.

System action

LPD continues.

Operator response

None.

Module

LPD

Procedure name

DoEndConnection

EZB0777I**Released ConnectionBlock at *address*****Explanation**

This message is issued while tracing is on. The storage space specified for the LPD connection was released because there were no jobs awaiting processing.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoEndConnection

EZB0778S**LPD terminating because *errmsg (msgnum)***

Explanation

This message is displayed while tracing is on. The LPD server has terminated operation.

errmsg is the text of the message that describes the error.

msgnum is the 4–digit numeric portion of the message identifier of the **EZA** message whose text is displayed in *errmsg*. For more information about this message, see message EZAmsgnum in the [z/OS Communications Server: IP Messages Volume 1 \(EZA\)](#).

System action

LPD halts.

Operator response

Notify system programmer.

System programmer response

Respond as indicated by the message EZAmsgnum.

Module

LPD

Procedure name

DoEndConnection

EZB0779I	New connection state state on connection address with reason errmsg (msgnum)
-----------------	---

Explanation

This message indicates that LPD has made a new connection state at the specified address.

errmsg is the text of the message that describes the error.

msgnum is the 4–digit numeric portion of the message identifier of the **EZA** message whose text is displayed in *errmsg*. For more information about this message, see message EZAmsgnum in the [z/OS Communications Server: IP Messages Volume 1 \(EZA\)](#).

System action

LPD continues.

Operator response

None.

System programmer response

Respond as indicated by the message EZAmsgnum.

Module

LPD

Procedure name

DoNewConnState

EZB0780I**Abort failed *errmsg* (*msgnum*)**

Explanation

This message is issued as a result of the LPD's unsuccessful attempt to disconnect the TCP connection.

errmsg is the text of the message that describes the error.

msgnum is the 4–digit numeric portion of the message identifier of the **EZA** message whose text is displayed in *errmsg*. For more information about this message, see message *EZAmsgnum* in the [z/OS Communications Server: IP Messages Volume 1 \(EZA\)](#).

System action

LPD continues.

Operator response

None.

System programmer response

Respond as indicated by the message *EZAmsgnum*.

Module

LPD

Procedure name

DoEndConnection

EZB0781I**Connection aborted because port number (number) is out of range.**

Explanation

This message is issued while tracing is on. The LPD connection was aborted because the stated port number was not defined as a legitimate port. Legitimate ports range from 721 to 731, inclusive.

System action

LPD continues.

Operator response

Notify the system programmer.

System programmer response

Use the PORT statement to define the legitimate ports. For more information about the PORT statement, see the [z/OS Communications Server: IP Configuration Reference](#).

Module

LPD

Procedure name

DoNewConnState

EZB0782I**Connection open. Reading command.****Explanation**

This message is issued while tracing is on. The LPD connection is open and now reading the submitted connection state command.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoNewConnState

EZB0783I**Aborting Connection *connection* - Timed out****Explanation**

The specified connection was aborted because the timer expired.

System action

LPD continues.

Operator response

None.

System programmer response

Assist the user as necessary. Use the TIMER command to set the timer to an appropriate time limit.

Module

LPD

Procedure name

DoConnectionTimeOut

EZB0784I**Could not retrieve MSG**

Explanation

LPD was unable to retrieve a queued Smsg. Therefore, the message could not be queued for processing.

System action

LPD continues.

Operator response

None.

System programmer response

See message EZB0800I.

Module

LPD

Procedure name

ProcessSMSG

EZB0785I Attempted SMSG from “user” ignored.

Explanation

The SMSG from the specified user was ignored. LPD was unable to locate the user ID in the OBEYFILE.

System action

LPD continues.

Operator response

Notify the system programmer.

System programmer response

Make sure the specified user ID is listed in the OBEYFILE using the OBEY command.

Module

LPD

Procedure name

ProcessSMSG

EZB0786I Command received “string”

System programmer response

None.

Module

LPD

Procedure name

ProcessTCP

EZB0800I**Ignoring TCP/IP notice *notification* on *connection***

Explanation

This message is issued while tracing is on. The TCP connection has failed or was not recognized. Use the type identifier issued in this message and the [z/OS Communications Server: IP Programmer's Guide and Reference](#) to determine and correct the problem.

System action

LPD continues.

Operator response

None.

System programmer response

Assist the user as necessary.

Module

LPD

Procedure name

ProcessTCP

EZB0801I **Filter *option* not supported. Job abandoned.**

Explanation

This message could display for one of the following reasons:

- The option type of the filters parameter used with the LPR command is not supported by the line printer daemon.
- The option type of the filters parameter for the SERVICE statement in the *hlq*.LPD.CONFIG data set is not supported by the line printer daemon.

System action

LPD continues.

Operator response

Correct the option type of the filters parameter for the LPR command or in the SERVICE statement of the *hlq*.LPD.CONFIG data set. Reissue the job. See [z/OS Communications Server: IP User's Guide and Commands](#) for information about the LPR command or the [z/OS Communications Server: IP Configuration Reference](#) for information about the SERVICE statement.

System programmer response

None.

Module

LPD

Procedure name

DoStartStep

EZB0802E **Could not open data file *dataset* Job abandoned.**

Explanation

LPD was unable to access the indicated data set. The print job is not completed.

System action

LPD continues.

Operator response

Reissue the print job with a valid data set name or PDS member. See [z/OS Communications Server: IP User's Guide and Commands](#) for more information about using the LPR command. None.

System programmer response

None.

Module

LPD

Procedure name

DoStepStart

EZB0803E	Could not define device for job. Unknown type <i>type</i> treated as “NONE”.
-----------------	---

Explanation

LPD encountered a printer type defined in the SERVICE statement that was not valid or unknown.

System action

LPD continues.

Operator response

None.

System programmer response

Correct the device type parameter for the SERVICE statement in *hlq*.LPD.CONFIG data set. For more information about the SERVICE statement, see [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

GetJobDevice

EZB0804E	<i>printer</i> kind is unknown <i>address</i>
-----------------	--

Explanation

LPD was not able to recognize the route parameter for the indicated printer. The route parameter was defined to something other than remote, local or NJE.

System action

LPD continues.

Operator response

Notify the system programmer of this message.

System programmer response

Correct the route parameter for the SERVICE statement in the *hlq*.LPD.CONFIG data set. For information about the SERVICE statement, see [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

GetJobDevice

EZB0805E	Could not allocate Spool Class <i>class</i>
-----------------	--

Explanation

The LPD server was unable to set a spool file for the specified printer class as a result of buffer exhaustion. See messages EZB0806I and EZB0807I.

System action

LPD continues.

Operator response

None.

System programmer response

Resubmit the LPD command.

Module

LPD

Procedure name

GetJobDevice

EZB0806I	Copies <i>copies</i>, Font <i>font</i>, form <i>form</i>, output <i>printer</i>
-----------------	--

Explanation

LPD issues this message when a nonzero return code is returned during spool file allocation. The number of copies, font size, form, and printer name are provided. See message EZB0807I.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoStartSending

EZB0821I Job *jobnumber* abandoned -- Open failed or no ports

Explanation

This message is issued while tracing is on.

- LPD was unable to open a connection to the specified REMOTE Print Server (LPD) on another host. A TcpOpen error occurred.
- LPD was unable to open a local port to the specified REMOTE Print Server (LPD) on another host. No ports in the range 721–731 were available.

In the message text:

jobnumber

The number assigned by the LPR client to this job.

System action

LPD continues.

Operator response

Resubmit the print job when a connection to the REMOTE print server can be established.

System programmer response

None.

Module

LPD

Procedure name

DoStartSending

EZB0822I

Sending command *number* with operand *address*

Explanation

This message is issued while tracing is on. LPD is sending the specified command to the specified printer address.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoOpenSending

EZB0823I

Sending ACK at end of data file on *connection* for job *jobnumber*

Explanation

This message is issued while tracing is on. The LPD server has read the data set on the specified connection for the specified job number and is sending an ACK.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

DoContinueSending

EZB0824I **ProcessWork starting on job queue**

Explanation

This message is issued while tracing is on. LPD is now processing the next job queued.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

ProcessWork

EZB0825I **Job *jobnumber* for *printer* dispatched in state *state***

Explanation

This message is issued while tracing is on. The job number, printer, and print state are displayed.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

ProcessWork

EZB0826E

Job *jobnumber* (state) abandoned - Incorrect state.

Explanation

LPD has terminated the processing of the specified job number because an incorrect job state was detected.

System action

LPD continues.

Operator response

Resubmit the job using the LPR command.

System programmer response

Make sure the failed job is mailed to the user using the MAIL command. For more information see the [z/OS Communications Server: IP Programmer's Guide and Reference](#).

Module

LPD

Procedure name

ProcessWork

EZB0827I

ProcessWork end with queue

Explanation

This message is issued while tracing is on. LPD has finished processing the queued jobs.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

ProcessWork

EZB0831I

IBM MVS LPD Version *version* on *date* at *time*

Explanation

When the LPD server is initialized this message is displayed. The LPD version number, date, and starting time are displayed.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

LPD MAIN

EZB0833I Could not get identity!

Explanation

The LPD server was unable to identify the user ID, host name, TCP service and domain name during its start up procedure. LPD does not start.

System action

LPD continues.

Operator response

None.

System programmer response

Make sure the user ID, host name, TCP service, and domain name have all been specified using the LPD command and its subcommands. For more information of the LPD command and its subcommands, see [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

LPD

Procedure name

LPD MAIN

EZB0834I Ready

Explanation

LPD is initialized and ready for processing.

System action

LPD is initialized.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

LPD MAIN

EZB0835I Ignored data is *string*

Explanation

This message displays while tracing is on; it is preceded by EZB0768I. Data was delivered on the connection, but because the data is unrecognizable, it is ignored. The connection is closed.

System action

LPD continues.

Operator response

See EZB0768I.

System programmer response

See EZB0768I. Use the data from the message to determine if the LPD was sent bad data.

Module

LPD

Procedure name

DoNewData

EZB0850I Using Table for DBCS Translate: *data set*

Explanation

The DBCS translation table has been successfully loaded from the binary translation table data set in the search order hierarchy.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

LoadDbcsTables

EZB0851I Could not load DBCS Translate Table: *data set*

Explanation

DBCS conversion is configured for the LPD, but the required DBCS translation table could not be loaded.

System action

The program continues.

Operator response

None.

System programmer response

Configure a valid DBCS binary translate table data set in the search order hierarchy for the required DBCS translation table. See [z/OS Communications Server: IP Configuration Reference](#) for more information about loading and customizing DBCS translation tables.

Module

LPD

Procedure name

LoadDbcsTables

EZB0852I Use a NLS option after "NLSTRANSULATE".

Explanation

An NLS option is expected after the NLSTRANSULATE keyword of the SERVICE statement of the *hlq*.LPD.CONFIG data set.

System action

LPD continues.

Operator response

None.

System programmer response

Specify the correct value in the parameter of NLSTRANS�ATE keyword of the SERVICE statement of the hlq.LPD.CONFIG data set and restart the program.

Module

LPD

Procedure name

ProcessNlsOptions

EZB0853E

Use an integer after *JOBPACING*.

Explanation

A number is expected after the JOBPACING statement in the hlq.LPD.CONFIG data set.

System action

LPD continues using the default value.

Operator response

None.

System programmer response

Specify the correct value for the parameter in the JOBPACING statement in the hlq.LPD.CONFIG data set and restart the program.

Module

LPD

Procedure name

PreparePrinters

EZB0854E

Use an integer after *STEPLIMIT*.

Explanation

A number is expected after the STEPLIMIT statement in the hlq.LPD.CONFIG data set.

System action

LPD continues using in the default value.

Operator response

None.

System programmer response

Specify the correct value for the parameter in the STEPLIMIT statement in the hlq.LPD.CONFIG data set and restart the program.

Module

LPD

Procedure name

PreparePrinters

EZB0855I	Loaded translation table from <i>dataset</i> for printer <i>printer_name</i>
-----------------	---

Explanation

The Line Printer Daemon (LPD) loaded the following SBCS translation table corresponding to the name provided by the TRANSLATETABLE or XLATETABLE statement in the *hlq*.LPD.CONFIG data set. This statement specifies the translation table to be used by the remote client for SBCS ASCII to EBCDIC translations.

dataset is the fully qualified data set name.

printer_name is the name of the printer service.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

PreparePrinters

EZB0856I	Loaded translation table from <i>dataset</i>
-----------------	---

Explanation

The Line Printer Daemon (LPD) loaded the SBCS translation table to be used if the printer service does not have TRANSLATETABLE or XLATETABLE statements specified.

dataset is the fully qualified data set name.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

ProcessOptions

EZB0857I

Using hardcoded translation tables.

Explanation

Hardcoded translation tables will be used because the Line Printer Daemon (LPD) was unable to load an SBCS translation table using the data set names of *jobname*.STANDARD.TCPXLBIN or *hlq*.STANDARD.TCPXLBIN. These tables are equivalent to *hlq*.STANDARD.TCPXLBIN, which are shipped with the product.

See [z/OS Communications Server: IP Configuration Reference](#) for more information about using translation tables including search order hierarchy and customization.

System action

LPD continues.

Operator response

None.

System programmer response

None.

Module

LPD

Procedure name

EZB0900I

command name version version

Explanation

Displays the line printer command used and the version level of the program. This message is displayed when you use the *version* parameter with the LPR, LPQ, LPRM, and LPRSET commands.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR, LPQ, LPRM, LPRSET

Procedure name

ProcessVersionOption

EZB0901E

The option *option* is ambiguous. Use a longer abbreviation.

Explanation

The abbreviated option submitted at the command line is ambiguous.

System action

The command is terminated.

Operator response

Reissue the required option with a longer abbreviation at the LPR command line. For a list of valid abbreviations using the LPR command, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR, LPRM

Procedure name

ProcessOptions

EZB0902E

Use a host name after HOST option.

Explanation

The HOST option was specified without indicating host name.

System action

The command is terminated.

Operator response

Reissue a valid host name at the HOST option. For a list of valid host names, contact the system operator.

System programmer response

None.

Module

LPR, LPQ, LPRM

Procedure name

ProcessOptions

EZB0903E

The option *option* was not recognized.

Explanation

The program cannot recognize the option you have entered. Valid options will be provided. This message will precede the valid options for your command.

System action

The command is terminated.

Operator response

Reissue the valid option using the LPR command.

System programmer response

None.

Module

LPQ, LPR, LPRM, LPRSET

Procedure name

ProcessOptions

EZB0904I

Use the ALL, HOST, PRINTER, TRACE, TYPE or VERSION options as needed.

Explanation

This message displays valid options that may be used with LPT, LPQ, and LPRM commands.

System action

The command is terminated.

Operator response

None.

System programmer response

None.

Module

LPQ, LPRM

Procedure name

ProcessOptions

EZB0905E

Use a printer name after PRINTER option.

System action

Processing continues.

Operator response

Use the LPRSET command to set up a default printer name. For more information see [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPQ, LPR, LPRM

Procedure name

ProcessOptions

EZB0908I	Printer name from global variable PRINTER = “<i>printer</i>”
-----------------	---

Explanation

LPR displays the default printer name, taken from the *user_id*.LASTING.GLOBALV data set. For more information about the *user_id*.LASTING.GLOBALV data set, see [z/OS Communications Server: IP Configuration Reference](#).

System action

Processing continues.

Module

LPR, LPQ, LPRM

Procedure name

ProcessOptions

EZB0909E	Use the PRINTER option this way: PRINTER nameofprinter<@printerhost>
-----------------	---

Explanation

You issued the PRINTER option with the *at-sign* without specifying the printer name.

System action

The command is terminated.

System programmer response

None.

Module

LPR, LPQ, LPRM

Procedure name

ProcessOptions.

EZB0912E	The printer name is not known.
-----------------	---------------------------------------

Explanation

The program does not recognize the printer name.

System action

Processing continues.

Operator response

Check the printer name at the server machine, and reissue the command with a valid printer name or use the LPRSET command to set a default printer name at the specified host. See [z/OS Communications Server: IP User's Guide and Commands](#) for more information about setting up a default printer in the *user_id*.LASTING.GLOBALV data set.

System programmer response

None.

Module

LPR, LPQ, LPRM

Procedure name

ProcessOptions

EZB0913E	The host name is not known.
-----------------	------------------------------------

Explanation

The program cannot determine the host name.

System action

The command is terminated.

Operator response

Use a valid host name with the command. The LPRSET command can be used to set up a default host name for a default printer. See [z/OS Communications Server: IP User's Guide and Commands](#) for more information about setting up a default host in the *user_id*.LASTING.GLOBALV data set.

System programmer response

None.

Module

LPR, LPQ, LPRM

Procedure name

ProcessOptions

EZB0914E	Please specify the printer name and host either as a command option or with the LPRSET command.
-----------------	--

Explanation

The program cannot determine the printer name or the printer host.

System action

Processing continues.

Operator response

Reissue your command with a valid printer name and host. The LPRSET command can be used to set a default printer and host using the GLOBALV variables in the *user_id*.LASTING.GLOBALV data set. For more information, see [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

If the problem continues, obtain more information using the TYPE or TRACE functions.

Module

LPR, LPQ, LPRM

Procedure name

ProcessOptions

EZB0915I	Begin “<i>cmd</i>” to printer “<i>printer</i>” at host “<i>foreignhost</i>”
-----------------	--

Explanation

This message indicates which printer and remote host are being used for your task. The task is indicated by “*cmd*” in the message, which can be LPR, LPQ, or LPRM.

System action

Processing continues.

Procedure name

SendCommand

EZB0918E**Command was not sent successfully****Explanation**

The command was not acknowledged by the remote host; therefore, the transmission was unsuccessful.

System action

The command is terminated.

Operator response

Reenter the command using the correct syntax.

System programmer response

Assist the operator if necessary.

Module

LPQ, LPRM

Procedure name

SendCommand

EZB0919I**InitEmulation failed****Explanation**

An error occurred initializing EC mode emulation. EC mode emulation is required to run TCPIP on a non-EC mode machine.

System action

Processing terminated.

Operator response

Reinitialize EC mode to on. If a problem occurs contact the system programmer.

System programmer response

EC-mode emulation can only be accessed when the processor is running. If a program is running in a 24-bit addressing mode, the program can be changed to a 31-bit addressing mode, which causes a branch to a module residing above the 16Mb virtual storage. For more information see *IBM Assembler Language Programming Book*.

LPR

Procedure name

SendControlFile

EZB0952E	Failed to send control line block. return code = rc and Error Number = <i>errno</i>.
-----------------	---

Explanation

The function that sends the data was unsuccessful. The current port number and the user IP address are displayed with this message.

errno is the z/OS UNIX System Services return code. return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](#).

System action

LPR halts.

Operator response

See [z/OS Communications Server: IP and SNA Codes](#) for information about TCP/IP return codes and the [z/OS UNIX System Services Messages and Codes](#) for information about the *errno*.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

SendControlFile

EZB0953E	Did not receive ACK for control file
-----------------	---

Explanation

The function TcpFReceive returned an FRECEIVEError, indicating that the receive request was rejected. The control file was not received.

System action

LPR halts.

Operator response

Make sure the receiving host is ready and try the request again.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

SendControlFile

EZB0954E File could not be opened.

Explanation

LPR was unable to open a data set.

System action

Processing continues.

Operator response

Verify that the data set is in storage accessible to LPR.

System programmer response

None.

Module

LPR

Procedure name

SendControlFile

EZB0955E File contains no valid print lines.

Explanation

The data set is empty.

System action

Processing continues.

Operator response

Make sure the data set you wish to print contains at least one character.

System programmer response

None.

Module

LPR

Procedure name

SendControlFile

EZB0956E Failed to send data block *errmsg* (*msgnum*)

Explanation

The attempt to send the information was unsuccessful.

errmsg is the text of the message that describes the error.

msgnum is the 4–digit numeric portion of the message identifier of the **EZA** message whose text is displayed in *errmsg*. For more information about this message, see message *EZAmsgnum* in the [z/OS Communications Server: IP Messages Volume 1 \(EZA\)](#).

System action

Processing continues.

Operator response

Notify the system programmer.

System programmer response

Respond as indicated by the message *EZAmsgnum*.

Module

LPR

Procedure name

SendLineFlush

EZB0957E Did not receive ACK for receive data file command. Code = *code*.

Explanation

The host did not receive an acknowledgment from the LPR receive data command.

System action

LPR halts.

Operator response

See z/OS Communications Server: IP and SNA Codes for information about return codes and error numbers. The current port number and the user IP address are displayed with this message.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

SendDataFile

EZB0958E	File could not be opened.
-----------------	----------------------------------

Explanation

The specified data set could not be opened.

System action

LPR halts.

Operator response

Verify that you have access to the data set and try to open it again.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

SendDataFile

EZB0959E	Did not receive ACK for data file
-----------------	--

Explanation

The remote host did not acknowledge that it received a data set.

System action

If no acknowledgement is received, the data set is retransmitted. Processing continues.

Operator response

Notify the system programmer of the error.

System programmer response

Check why LPD did not send acknowledgement. Starting LPD (server) with “DEBUG” on, will help.

Module

LPR

Procedure name

SendDataFile

EZB0960E**Did not receive ACK after close**

Explanation

The remote host did not send a message acknowledging that it has closed. The connection remains open.

System action

Processing continues.

Operator response

Try to close the connection again.

System programmer response

None.

Module

LPR

Procedure name

DrainConnection

EZB0961I**Control file name is *dataset name***

Explanation

The name of the control data set is displayed.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

MakeFileNames

EZB0962I

Data file name is *dataset name*

Explanation

The name of the current data set is displayed.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

MakeFileNames

EZB0965E

Use the form: *command name* DataSetName.

Explanation

This message displays the correct format for the indicated command. For more information about the commands, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System action

The command is not processed.

Operator response

Reenter the command using the form given in the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

ProcessOperands

EZB0967E

Data Set name “*name*” invalid.

Explanation

The specified data set name is incorrect.

System action

The command is not processed.

Operator response

Make sure that the data set name uses the correct format and syntax and that the data set is in storage accessible to the host.

System programmer response

Assist the user as necessary.

Module

LPD, LPR

Procedure name

ProcessOperands

EZB0968E

Data Set “*name*” not found or inaccessible, return code = *rc*.

Explanation

This message may issue one of the following return codes:

Return code

Description

4

Data set name not found

12

Data set name is missing

24

Data set is an unprintable VSAM file

If another return code is issued, this indicates that the data set attributes may make the data set inaccessible.

System action

LPR halts.

Operator response

Reenter the LPR command using the correct data set name. If the data set name is correct, check the data set attributes.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

ProcessOperands

EZB0969E Data Set "*name*" does not contain member "*member*".

Explanation

The specified data set name does not contain the specified member name.

System action

The LPR command is not processed.

Operator response

Reenter the command using the correct data set name and the correct member name.

System programmer response

None.

Module

LPR

Procedure name

ProcessOperands

EZB0970E Data Set "*name*" invalid organization.

Explanation

The function FindDSName exited abnormally because the file's organization was incorrect.

System action

Processing continues.

Operator response

Recheck the organization and reenter the file. Notify the system programmer if the problem persists.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

ProcessOperands

EZB0971E

Use a matching quotation mark at the end of the string.

Explanation

There is a missing quotation mark at the end of the string.

System action

The LPR command is not processed.

Operator response

Make sure there are appropriate quotation marks and reenter the string.

System programmer response

None.

Module

LPR

Procedure name

LPRToken

EZB0973E

Use either BINARY or NOBINARY but not both.

Explanation

Either BINARY or NOBINARY can be chosen. Data cannot be sent as BINARY and NOBINARY.

System action

The LPR command is not processed.

Operator response

Reenter the LPR command specifying either the BINARY or NOBINARY options.

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0974E

Use a token after the CLASS option.

Explanation

No filter was specified after the filter option in the LPR command. The filter option specifies the type of processing to be done with the data.

System action

The LPR command is not processed.

Operator response

Reenter the LPR command using the filter option with a valid filter. See [z/OS Communications Server: IP User's Guide and Commands](#) for more information about the LPR command.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

ProcessOptions

EZB0977E Use a number after the INDENT option.

Explanation

A numeric argument was not specified for the INDENT option of the LPR command.

System action

LPR command is not processed.

Operator response

Reenter the LPR command, specifying a numeric argument for the INDENT option. For more information about the LPR command and the INDENT option, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0978E Use a token after the JOB option.

Explanation

You must specify a name when using the JOB option. The name is the printing job's description to the remote system.

System action

The LPR command is not processed.

Operator response

Reenter the LPR command with a name following the JOB option. For more information about the JOB option of the LPR command see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0979E Use a number after the LINECOUNT option.

Explanation

You must enter a number following the LINECOUNT option to specify the number of lines to be printed before a new heading is printed.

System action

The LPR command is not processed.

Operator response

Reenter the LPR command with the LINECOUNT option using a valid number. For more information see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0980E Use an identification after NAME option.

Explanation

You did not specify a name after the NAME option in the LPR command. (The NAME option specifies the job information to be provided by the remote system in response to a query.)

System action

The LPR command is not processed.

Operator response

Resubmit the LPR command supplying a name after the NAME option. For more information about the LPR command and the NAME option, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0981E Use a title after the TITLE option.

Explanation

You did not specify the title after the TITLE option in the LPR command.

System action

The LPR command is not processed.

Operator response

Resubmit the LPR command supplying a name after the TITLE option. For more information about the LPR command and the TITLE option, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0982E Use a number after the TOPMARGIN option.

Explanation

You did not specify a number after the TOPMARGIN option in the LPR command. (This number specifies the number of lines designated for the top margin).

System action

The LPR command is not processed.

Operator response

Resubmit the LPR command supplying the number of lines to be designated for the top margin. For more information about the LPR command and the TITLE option, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0983E Use a title after the WIDTH option.

Explanation

You did not specify the line width after the WIDTH option in the LPR command.

System action

The LPR command is not processed.

Operator response

Resubmit the LPR command supplying the line width of the data set. For more information about the LPR command and the WIDTH option see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0984E Use either the NOPOSTSCRIPT or POSTSCRIPT option but not both.

Explanation

You selected both the POSTSCRIPT and the NOPOSTSCRIPT options in the LPR command. You can select only one of these options.

System action

The LPR command is not processed.

Operator response

Reissue the command with the correct option. For more information about the LPR command and the POSTSCRIPT or NOPOSTSCRIPT options, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0985E	Use either the POSTSCRIPT or LANDSCAPE option but not both.
-----------------	--

Explanation

You selected both the POSTSCRIPT and LANDSCAPE options in the LPR command. You can select only one of these options.

System action

The LPR command is not processed.

Operator response

Reissue the command with the correct option. For more information about the LPR command and the POSTSCRIPT or NOPOSTSCRIPT options, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0986E	Use either the BINARY OR LANDSCAPE option but not both.
-----------------	--

Explanation

You selected both the BINARY and LANDSCAPE options in the LPR command. You may select only one of these options. If you select the LANDSCAPE option, the only valid filter option that you can specify explicitly is the "o" filter.

System action

The LPR command is not processed.

Operator response

Reissue the command using the correct option. For more information about the LPR command and the BINARY or LANDSCAPE options, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0987E	Use either the FILTER or LANDSCAPE option but not both.
-----------------	--

Explanation

You selected both the FILTER and LANDSCAPE options in the LPR command. You may select only one of these options. If you select the LANDSCAPE option, the only valid filter option that you can specify explicitly is the "o" filter.

System action

The LPR command is not processed.

Operator response

Reissue the command with the correct option. For more information about the LPR command and the FILTER or LANDSCAPE options, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0988I	PostScript program is <i>number</i> bytes.
-----------------	---

Explanation

This message specifies the number of bytes in the PostScript program.

System action

The LPR command is not processed.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

ProcessOptions

EZB0989I	Use these options.
EZB0990I	<i>additional options</i>
EZB0991I	<i>additional options or last options</i>

Explanation

TCPIP issues this message when one or more incorrect options is specified in the LPR command. It provides a list of valid options.

System action

The LPR command is not processed.

Operator response

Reissue the LPR command using valid options.

System programmer response

None.

Module

LPR, LPRSET

Procedure name

ProcessOptions

EZB0992I	File contains PostScript.
-----------------	----------------------------------

Explanation

TCPIP issues this message when tracing is on and PostScript characters are detected in the data set.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendControlFile

EZB0993E	Use the program which produced the PostScript to change to landscape display.
-----------------	--

Explanation

The LANDSCAPE option is specified in the LPR command and the file to be printed is a PostScript data set.

System action

The LPR command is not processed.

Operator response

Redefine the data set for landscape display using the original application program that created the POSTSCRIPT file. Then reissue the LPR command without the LANDSCAPE option. See also EZB1010E.

System programmer response

None.

Module

LPR

Procedure name

SendControlFile

EZB0994E	Use the NOPOSTSCRIPT option to prevent special processing of PostScript files.
-----------------	---

Explanation

The LPR command contains both POSTSCRIPT and CC options.

System action

The LPR command is not processed.

Operator response

Reissue the LPR command using the NOPOSTSCRIPT option in place of the POSTSCRIPT option. For more information about the LPR command and the POSTSCRIPT and NOPOSTSCRIPT options, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

None.

Module

LPR

Procedure name

SendControlFile

EZB0995W

Ignoring “buffer”

Explanation

TCPIP issues this message when an incorrect carriage control character is detected. The lines containing those incorrect characters are ignored.

System action

Processing continues.

Operator response

Correct the carriage control characters in the data set.

System programmer response

None.

Module

LPR

Procedure name

SendControlFile

EZB0996W

***number* lines with invalid carriage control characters deleted.**

Explanation

TCPIP issues this message when incorrect carriage control characters are detected in the data set that is being processed. The lines containing the incorrect carriage control characters are deleted.

System action

Processing continues.

Operator response

Correct the carriage control characters in the data set and resubmit the job.

System programmer response

None.

Module

LPR

Procedure name

SendControlFile

EZB0997I**Byte size check starts at *date time*****Explanation**

TCPIP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. The date and time are recorded before performing a byte size check of the data set.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB0998I**Byte size check ends at *date time*****Explanation**

TCPIP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. The date and time are recorded after performing a byte size check of the data set.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB0999I**Send command starts at *date time***

Explanation

TCPIP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. Arguments are passed prior to the actual data transfer. The date and time are recorded before those arguments are passed.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

Chapter 3. EZB1xxxx messages

EZB1000I

Send command ends at *date time*

Explanation

TCPIP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. After arguments are passed and acknowledgments are received, the date and time are recorded.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1001I

Send data starts at *date time*

Explanation

TCPIP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. Before the data set is sent to the remote printer, the date and time are recorded.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1002I**Send data ends at *date time***

Explanation

TCPIP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. When the data set is received by the remote printer, the date and time are recorded.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1003I**Send ACK starts at *date time***

Explanation

TCPIP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. TCPIP initiates an acknowledgment process. The date and time are recorded.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1004I**Send ACK ends at *date time***

Explanation

TCPIP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. When the requested acknowledgments are received, the acknowledgment process is complete; the date and time are recorded.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1005I	Draining the connection.
-----------------	---------------------------------

Explanation

This message occurs while the data is sent from the host to the remote printer and tracing is on. Before the connection between the host and the remote printer closes, the information is taken in and processed by the printer.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

DrainConnection

EZB1006E	Host <i>host</i> did not accept printer name <i>printer</i>
----------	---

Explanation

The indicated host did not recognize the indicated printer.

System action

The LPR command is not processed.

Operator response

Resubmit the job using the correct host printer name.

System programmer response

None.

Module

LPR

Procedure name

DrainConnection

EZB1007I Connection still receiving - aborting it.**Explanation**

TCPIP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. The remote host continues to receive information. When all the information is received, the connection is aborted.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

DrainConnection

EZB1008I Connection aborted.**Explanation**

TCPIP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. TCPIP ended the connection with the remote host.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

DrainConnection

EZB1009I Data file sent.

Explanation

TCP/IP issues this message when tracing is on and a data set is sent to the remote printer using the LPR command. The data set has been successfully sent.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1010E Use the program which produced the PostScript to control pagination.

Explanation

This message follows EZB0993E and is issued when the LANDSCAPE option is specified in the LPR command and the file to be printed is a PostScript data set.

System action

The LPR command is not processed.

Operator response

Redefine the data set to control pagination using the original application program that created the POSTSCRIPT file. Then reissue the LPR command without the LANDSCAPE option.

System programmer response

None.

errno is the z/OS UNIX System Services return code. return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](#).

System action

LPR halts.

Operator response

See [z/OS Communications Server: IP and SNA Codes](#) for information about TCP/IP return codes and the [z/OS UNIX System Services Messages and Codes](#) for information about the *errno*.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1047E	Send Control File failed. return code = rc. Error Number = <i>errno</i>.
-----------------	---

Explanation

An error was detected while attempting to send the file format information. The current port number and the user IP address are displayed with this message.

errno is the z/OS UNIX System Services return code. return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](#).

System action

LPR halts.

Operator response

See [z/OS Communications Server: IP and SNA Codes](#) for information about TCP/IP return codes and the [z/OS UNIX System Services Messages and Codes](#) for information about the *errno*.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1048E	Send Data File failed. return code = rc. Error Number = <i>errno</i>.
-----------------	--

Explanation

An error was detected while attempting to send the data file containing the file data. The current port number and the user IP address are displayed with this message.

errno is the z/OS UNIX System Services return code. return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](#).

System action

LPR halts.

Operator response

See z/OS Communications Server: IP and SNA Codes for information about TCP/IP return codes and the [z/OS UNIX System Services Messages and Codes](#) for information about the *errno*.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1049E **Send printer command did not receive ACK. ACK message = *message*.**

Explanation

No acknowledgment was received from the server while attempting to send a printer command. An acknowledgment message was passed. The current port number and the user IP address are displayed with this message.

System action

LPR halts.

Operator response

Use the ACK message to determine and correct the problem.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

SendDataFile

EZB1050E **Failed to Send Data. return code = *rc*. Error Number = *errno* port number = *port* remote ip address = *ipaddr***

Explanation

An error was detected while attempting to send data to the server machine.

rc is the return code from the subroutine that was called.

errno is the z/OS UNIX System Services return code. return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](#).

port is the number of the connecting port.

ipaddr is the remote IP address.

System action

LPR halts.

Operator response

If *rc* is -1 and *errno* is 0, then there was a read error while trying to access the DBCS translation tables. Check your translation tables and their location. Correct any problems with the DBCS translation tables and try the LPR command again.

If *rc* is -2 and *errno* is 0, then there are DBCS characters that are not valid in the print file that you are trying to send. Turn on the trace option in LPR to see more messages from the translation routines. Correct the print file and try the LPR command again.

If *rc* is -1 and *errno* is nonzero, then look up the *errno* in the [z/OS UNIX System Services Messages and Codes](#) for help in diagnosing the exact problem.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1051E	Failed to Open connection to Port Number = <i>port</i>. return code = <i>rc</i> error number = <i>errno</i> port number = <i>port</i> remote ip address = <i>ipaddr</i>
-----------------	--

Explanation

The attempt to open a connection at the stated port was unsuccessful. The requested port, return code, error number, current port, and the IP address are displayed with this message.

errno is the z/OS UNIX System Services return code. return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](#).

System action

LPR halts.

Operator response

Try to access the stated port number again. If the problem persists, notify the system programmer.

System programmer response

See [z/OS Communications Server: IP and SNA Codes](#) for information about TCP/IP return codes and the [z/OS UNIX System Services Messages and Codes](#) for information about the *errno*.

Module

LPR

Procedure name

SendDataFile

EZB1052E **StartTcpi: return code = *rc* and Error Number = *errno*.**

Explanation

An error was detected while attempting to initialize TCPIP.

errno is the z/OS UNIX System Services return code. return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](#).

System action

LPR halts.

Operator response

See [z/OS Communications Server: IP and SNA Codes](#) for information about TCP/IP return codes and the [z/OS UNIX System Services Messages and Codes](#) for information about the *errno*.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

SendDataFile

EZB1053E **Could not set option. return code = *rc* and Error Number = *errno*.**

Explanation

While attempting to set the socket KeepAlive option, an error was detected.

errno is the z/OS UNIX System Services return code. return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](#).

System action

LPR halts.

Operator response

See [z/OS Communications Server: IP and SNA Codes](#) for information about TCP/IP return codes and the [z/OS UNIX System Services Messages and Codes](#) for information about the *errno*.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1054E**TcpClose: return code = *rc* and Error Number = *errno*.**

Explanation

While attempting to close the TCP connection on both the client and server machines an error was detected. The current port number and the user IP address are displayed with this message.

errno is the z/OS UNIX System Services return code. return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](#).

System action

LPR halts.

Operator response

See [z/OS Communications Server: IP and SNA Codes](#) for information about TCP/IP return codes and the [z/OS UNIX System Services Messages and Codes](#) for information about the *errno*.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1055E**Use a three-digit number after the JNUM option.**

Explanation

The value specified for JNUM is not valid. It is either missing, greater than or less than three digits, or is not numeric. The JNUM value can be any 3-digit number in the range 000—999. The print job is not processed.

System action

LPR halts.

Operator response

Correct the JNUM value specified on the LPR command.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

ProcessOptions

EZB1056E Invalid Internet address *Foreignhost*.

Explanation

You provided an address containing numbers greater than 255. This is an invalid IP address for LPR.

System action

LPR halts.

Operator response

Check the IP address to which you are sending your output.

System programmer response

Assist the user as necessary.

Module

LPR

Procedure name

MainLoop

EZB1057I Loaded translation table from *data set name*

Explanation

The fully qualified data set name used by LPR for the translation tables is displayed. These tables are used to translate EBCDIC to ASCII and ASCII to EBCDIC. This message may be issued more than once if more than one table is loaded. The last table loaded of a particular type will be the one used. (This will be the one cited in the last occurrence of this message).

System action

Processing continues.

Operator response

If the data set name displayed is not the one desired, verify that the expected data set exists. The search order used by LPR to find the translation data set is described in the [z/OS Communications Server: IP Configuration Reference](#). If the data set name displayed is empty (" "), then no translate data set was found in the search order. Create the desired translate table, or correct the TRANSLATE option specified on the LPR command.

System programmer response

Verify that the system translate tables are correctly installed under the correct high level qualifier (for example, *hlq.STANDARD.TCPXLBIN*). For information about determining the high level qualifier used, see the [z/OS Communications Server: IP Configuration Reference](#).

Module

LPR

Procedure name

ProcessOptions

EZB1058E

Data Set *dataset_name* not found

Explanation

The line printer requester (LPR) was unable to find the data set that was used in the invocation of the LPR command.

In the message text:

dataset_name

The name of the data set that could not be found.

System action

LPR ends.

Operator response

No action is needed.

System programmer response

Assist the user, as necessary.

User response

Reenter the LPR command using a correct data set name. If the data set name is correct, verify that the data set exists and is cataloged. If the data set does exist and is cataloged, contact the system programmer.

Problem determination

```
EZB1059E Data Set USER1.TCPIP.DATA larger than 2,147,483,647 bytes
```

EZB1098I**return code = rc. Error Number = *errno*.**

Explanation

See the user response. The text of this message is usually appended to the end of other messages.

errno is the z/OS UNIX System Services return code. return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](#).

System action

Depending on the return code and error number in this message, LPR process may continue or may terminate.

Operator response

See z/OS Communications Server: IP and SNA Codes for information about TCP/IP return codes and the [z/OS UNIX System Services Messages and Codes](#) for information about the *errno*. If the return code is -1 and error number is 0, then negative acknowledgment was received from the server. Turn on the trace for the server to find out why the server rejected the LPR request.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1099I**Port Number = *port*. Remote IP Addr = *target address***

Explanation

See the user response. The text of this message is usually appended to the end of other messages. This message displays the port number and the IP address currently in use.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

LPR

Procedure name

SendDataFile

EZB1100I

Cannot load translate table with name - *name* using defaults

Explanation

The Line Printer Request (LPR) attempted to load an SBCS translation table corresponding to the TRANSLATETABLE or XLATETABLE parameter specified on the LPR command line. All data sets in the search order hierarchy for the required translate table data set, either do not exist, or do not contain data in the required format for SBCS binary translate tables.

name is an input string that becomes part of the translation table data set name (for example, *hlq.name.TCPXLBIN*).

System action

LPR continues, however, default hardcoded tables are used for translations.

Operator response

Notify the system programmer.

System programmer response

Configure a valid SBCS binary translate table data set in the search order hierarchy for the required SBCS translation table. See [z/OS Communications Server: IP Configuration Reference](#) for more information about using translation tables, including search order hierarchy and customization.

EZB1200E

Error parsing argument “*option*” (*specifier*) ; unknown kind

Explanation

XWindows has encountered an option or specifier that it does not recognize in a user-submitted command line. The command line is not processed.

System action

XWindows continues.

Operator response

Correct the syntax and resubmit the command.

System programmer response

None.

Module

PARSECMD

Procedure name

_XReportParseError

EZB1201E

Bad image *image_type*: error found in routine: *routine*

Explanation

Xwindows received an incorrect image type from the indicated routine. The image type and Xwindows error code are displayed in the message.

System action

Xwindows halts.

Operator response

Notify the system programmer of the error.

System programmer response

Use the error code given in the message and [z/OS Communications Server: IP and SNA Codes](#) to determine the cause of the error, and correct the indicated routine as necessary.

Module

XIMUTIL

Procedure name

_XReportBadImage

EZB1202E

Xlib: warning, client built for newer rev (*rev_number*) than server (*rev_number*)!

Explanation

The Xwindows client code was built for a newer version of Xwindows than the Xwindows server code. This can result in compatibility errors.

System action

Xwindows halts.

Operator response

Notify the system programmer of the error.

System programmer response

Correct either the client code or the server code to eliminate the revision disparity and rebuild the code.

Module

XOPENDIS

Procedure name

_XRead

EZB1203E**Xlib: warning, client is protocol rev *revision*, server is rev *revision*!**

Explanation

The Xwindows server is using a different revision of the Xwindows code than the client. This can cause compatibility problems.

System action

Xwindows halts.

Operator response

Notify the system programmer of the error.

System programmer response

Correct the disparity in revision levels between the client and the server and restart Xwindows.

Module

XOPENDIS

Procedure name

_XRead

EZB1204E**Xlib: connection to *server* refused by server**

Explanation

This message indicates that no authorization exists between the Xwindow server and the client program. The error causes the server to refuse the connection. The connection is not established.

System action

No Xwindows session can be opened for this client.

Operator response

Issue an Xhost command from the Xserver side.

System programmer response

None.

Module

XOPENDIS

Procedure name

Main

EZB1205E**Xlib: sequence lost (*0xnumber_received* > *0xnumber_expected*) in reply type *0xreply_type*!**

Explanation

The Xwindows server received a reply packet with a sequence number greater than the sequence number expected, indicating that a reply packet has been lost.

System action

Xwindows halts processing.

Operator response

Notify the system programmer of the error.

System programmer response

Check the indicated Xclient to determine why the packet was lost and respond as indicated.

Module

XLIBINT

Procedure name

_XSetLastRequestRead

EZB1206E	Xlib: unhandled wire event! event number = <i>number</i>, display = <i>display_number</i>
-----------------	--

Explanation

Xwindows encountered an unknown event during conversion between the host format and the wire format.

System action

Xwindows halts.

Operator response

Notify the system programmer of the error.

System programmer response

Check the XEvent structure to make sure it is compatible with the current host. For more information, see the Xwindows documentation.

Module

XLIBINT

Procedure name

_XUnknownWireEvent

EZB1207E	Xlib: unhandled native event! event number = <i>number</i>, display = <i>display_number</i>
-----------------	--

Explanation

Xwindows encountered an unknown event while reformatting a wire event to the host structure.

System action

Xwindows halts.

Operator response

Notify the system programmer of the error.

System programmer response

Check the XEvent structure to make sure that it is compatible with the current host. For more information see the Xwindows documentation.

Module

XLIBINT

Procedure name

_XUnknownNativeEvent

EZB1208E	XIO: fatal IO error <i>error_description</i> on X server <i>address_of_server</i>
EZB1209E	after <i>number</i> requests (<i>number</i> known processed) with <i>number</i> events remaining. <i>err_no</i> (error) on X server “<i>server</i>”

Explanation

The Xwindows server encountered an I/O error during processing. The type of error is indicated in the message. The error description portion of this message indicates the cause of the error.

System action

Xwindows halts.

Operator response

Notify the system programmer of the error.

System programmer response

Respond as indicated by the *error_description* portion of this message.

Module

XLIBINT

Procedure name

_XDefaultIOError

EZB1210I	The connection was probably broken by a server shutdown or KillClient.
-----------------	---

Explanation

If this message follows messages EZB1208E and EZB1209E, it indicates that the error displayed in those messages was probably caused by the shutdown of the Xwindows server, or by the procedure KillClient, which closes a connection to an Xwindows client.

System action

Xwindows halts.

Operator response

Notify the system programmer of the error.

System programmer response

Check the Xwindows server to determine why it shut down or closed the client connection.

Module

XLIBINT

Procedure name

_XDefaultIOError

EZB1211I Request failed due to IUCV error.

Explanation

This message follows messages EZB1208E and EZB1209E, and indicates that the error displayed in those messages was caused by a failure in the inter-user communication vehicle (IUCV). Xwindows uses IUCV to transmit requests and receive replies.

System action

Xwindows halts.

Operator response

Notify the system programmer of the error.

System programmer response

See additional messages to determine the cause of the IUCV error and respond as indicated.

Module

XLIBINT

Procedure name

_XDefaultIOError

EZB1212E Xlib: extension “*extension*” reason on display “*display*”.

Explanation

Xwindows encountered an incorrect event handler when the function XSetExtensionErrorHandler or XMissingExtension is called.

System action

Xwindows halts.

Operator response

Notify the system programmer of the error.

System programmer response

Make sure that the event handler is set correctly before calling the associated extension. For more information see the Xwindows documentation.

Call caller's name (caller's address) from previous caller in previous caller's name (previous caller's address)

Explanation

This debug message displays the name of the current subroutine and the calling subroutine.

System action

The X25 server continues processing.

Operator response

None.

System programmer response

Use the trace in problem determination.

Module

XNX25IPI

Procedure name

FOLLOW

EZB2084E

Posted ECB at address had no handler

Explanation

The X25IPI event control block at this address did not specify an event handler routine.

System action

TCPIP continues.

Operator response

Tell the system programmer about the error.

System programmer response

If the error recurs, obtain a dump of the X25IPI address space to make sure that the correct event handler is loaded.

Module

XNX25IPI

Procedure name

None.

EZB2085E

ECB address being added twice to wait list

Explanation

The X25IPI routine that adds elements to the ECB wait list detected an attempt to add an ECB twice.

System action

TCPIP continues.

Operator response

Notify the system programmer about the error

System programmer response

Determine the external event that caused this condition. Re-create it with an X25 internal trace running. Obtain a dump of the X25 region and submit the dump to IBM software support services

Module

XNX25IPI

Procedure name

None.

EZB2090I**Terminating**

Explanation

X25IPI is terminating its execution and shutting down.

System action

The VTAM ACB is closed.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2091I**HALT notice accepted type type**

Explanation

X25IPI received a VTAM HALT notification or a HALT console command and is shutting down execution.

System action

VTAM LU sessions are closed, and the IUCV connection to the TCPIP address space is severed.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2092T	Stack overflow at address
-----------------	----------------------------------

Explanation

X25IPI encountered a stack overflow at the indicated address. ABEND message X'091' is displayed.

System action

X25IPI abends.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the cause of overflow, and submit the ABEND dump to IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2093T	Buffer released twice at address in routine (address)
-----------------	--

Explanation

X25IPI encountered a consistency error in its buffer allocation pool. A buffer was released twice. This indicates a programming error. Return code X'92'. is displayed.

System action

X25IPI abends.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the cause of the consistency error, and submit the ABEND dump to IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2094S**NPSI SEND completion, pending packet = *packet number***

Explanation

A program flag indicating a deferred control packet to be sent has an unacceptable value. The pending condition is reset.

System action

TCPIP continues.

Operator response

Tell the system programmer about the error.

System programmer response

Contact IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2095T**WTO text overflow**

Explanation

XNX25IPI encountered an overflow in the Write To Operator (WTO) area, which is used to display informational and error messages. ABEND message X'099' is displayed.

System action

The program abends.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the cause of the overflow, and submit the ABEND dump to IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2099I **Ended**

Explanation

X25IPI has finished processing.

System action

The X25IPI program exits.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2100I *configuration dataset record*

Explanation

This debug message displays a record that was read from the configuration data set.

System action

The X25 server continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

X25IPI1

EZB2101E

Unable to open configuration file, DDNAME=X25IPI

Explanation

X25IPI encountered an error opening its X25IPI configuration data set.

System action

X25IPI does not start.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the DD for the X25IPI configuration data set.

Module

XNX25IPI

Procedure name

None.

EZB2102E

Unrecognized configuration entry: *keyword*

Explanation

X25IPI encountered an unrecognized entry in its X25IPI configuration data set. This configuration record is skipped; further configuration errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the entry in the X25IPI configuration data set.

Module

XNX25IPI

Procedure name

None.

EZB2103E

Missing configuration entry: *keyword*

Explanation

X25IPI could not find the indicated keyword in its configuration data set. You should have at least one entry defining a link in the file.

System action

X25IPI does not start.

Operator response

Tell the system programmer about the error.

System programmer response

Add a Link definition to the X25IPI configuration data set for each indicated keyword to be used for TCPIP traffic.

Module

XNX25IPI

Procedure name

None.

EZB2104E **Buffer storage not available (*bytes bytes required*)**

Explanation

X25IPI could not allocate sufficient storage during initialization.

System action

X25IPI does not start.

Operator response

Tell the system programmer about the error.

System programmer response

Increase the X25IPI region or address space storage size to the indicated number of bytes.

Module

XNX25IPI

Procedure name

None.

EZB2106E **DLC Init function X25IPI failed R15=*value***

Explanation

X25IPI encountered an error issuing a DLC Init call.

System action

X25IPI does not start.

Operator response

Tell the system programmer about the error.

System programmer response

Verify that the X25IPI procedure is in the PROCLIB.

Module

XNX25IPI

Procedure name

None.

EZB2107T	Programming error: not enough buffers allocated
-----------------	--

Explanation

The calculation of the number of buffers to allocate was incorrect.

System action

X25IPI does not start.

Operator response

Tell the system programmer about the error.

System programmer response

Contact IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2108I	Unable to obtain TCPIPJobname from TCPIP.DATA, default TCPIP job name used
-----------------	---

Explanation

X25IPI encountered an error obtaining the TCP/IP stack name from the TCPIP.DATA file. The default job name of TCPIP is being used.

System action

TCPIP continues.

Operator response

If TCP connections cannot be made, notify the system programmer.

System programmer response

If the job name of the TCPIP stack to be used by X25 is not TCPIP use the TCPIP.DATA TCPIPJOBNAME statement to specify the correct name. See [z/OS Communications Server: IP Configuration Guide](#) for how TCPIP.DATA statements are searched for.

Module

XNX25IPI

Procedure name

None.

EZB2110E **Unrecognized trace level: *level***

Explanation

The trace level, specified in either the X25IPI configuration data set or the TRACE command, is not correct. The trace level is set to “off”.

System action

TCPIP continues.

Operator response

Reissue the TRACE command with valid trace level.

System programmer response

Correct the Trace entry in the X25IPI configuration data set.

Module

XNX25IPI

Procedure name

None.

EZB2111I **VTAM ACB *IPI_APPN* opened successfully**

Explanation

The virtual transmission access method (VTAM) address space successfully opened an activity control block (ACB) for the indicated application.

System action

The application begins processing. TCPIP continues.

Operator response

None.

System programmer response

None.

Module

xnx25ipi

Procedure name

main

EZB2112E Repeated VTAM record ignored: *record*

Explanation

X25IPI encountered more than one VTAM entry in the X25IPI configuration data set. The repeated VTAM record is skipped.

System action

Initialization continues.

Operator response

Tell the system programmer about the error.

System programmer response

Remove the repeated VTAM record.

Module

XNX25IPI

Procedure name

None.

EZB2113E VTAM application name missing

Explanation

The VTAM application ID is missing on the VTAM entry in the X25IPI configuration data set.

System action

X25IPI does not start.

Operator response

Tell the system programmer about the error.

System programmer response

Specify the VTAM application ID and password on the VTAM entry.

Module

XNX25IPI

Procedure name

None.

EZB2114E**VTAM application password missing****Explanation**

The VTAM application password is missing on the VTAM entry in the X25IPI configuration data set.

System action

X25IPI does not start.

Operator response

Tell the system programmer about the error.

System programmer response

Specify the VTAM application password on the VTAM entry.

Module

XNX25IPI

Procedure name

None.

EZB2115E**VTAM ACB *application* open failed****Explanation**

X25IPI encountered an error opening the VTAM ACB. This message is preceded by a EZB2401E or EZB2402E message reporting the VTAM error code.

System action

X25IPI does not start.

Operator response

Activate the X25IPI application in VTAM.

System programmer response

Use the VTAM error code from the message EZB2401E or EZB2402E to determine why the VTAM ACB OPEN macro was unsuccessful.

Module

XNX25IPI

Procedure name

None.

EZB2121E**DDN and non-DDN links cannot be mixed****Explanation**

X25IPI encountered Link statements in its X25IPI configuration data set specifying both DDN and non-DDN links. The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Separate DDN and non-DDN links into 2 X25IPI virtual machines.

Module

XNX25IPI

Procedure name

None.

EZB2122E**Link LU name missing****Explanation**

The NPSI MCH LU name is missing on the Link entry in the X25IPI configuration data set. The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Complete the Link entry. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Link definition.

Module

XNX25IPI

Procedure name

None.

EZB2123E**Link DTE address missing**

Explanation

X25IPI encountered a Link statement without a DTE address specified. This field is required for all non-DDN links. The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Complete the Link entry. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Link definition.

Module

XNX25IPI

Procedure name

None.

EZB2124E**Link window size missing or not numeric**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set that had a missing or nonnumeric default window size specification. The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the window size. See [z/OS Communications Server: IP Configuration Reference](#) for the format of the Link definition.

Module

XNX25IPI

Procedure name

None.

EZB2125E**Link window size not in range 1..7 or 1..127**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set with an incorrect default window size specification. The window size should be in the range 1–7 or 1–127. The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the window size.

Module

XNX25IPI

Procedure name

None.

EZB2126E**Link packet size missing or not numeric**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set that had a missing or nonnumeric default packet size. The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the packet size. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Link definition.

Module

XNX25IPI

Procedure name

None.

EZB2127E**Link packet size unacceptable**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set with an incorrect default packet size specification. The size should be 32, 64, 128, 256, 512, 1024, 2048, or 4096. The Link entry is discarded; further errors can result.

System action

The link entry is discarded. Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the packet size.

Module

XNX25IPI

Procedure name

None.

EZB2128E**Link logical channel count missing or not numeric**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set that had a missing or nonnumeric logical channel count field. The Link entry is discarded; further errors can result.

System action

The Link entry is discarded. Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the channel count. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Link definition.

Module

XNX25IPI

Procedure name

None.

EZB2129E**Link logical channel count not in range 1..1023**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set with an incorrect logical channel count field. The count should be in the range 1–1023. The Link entry is discarded; further errors can result.

System action

The Link entry is discarded. Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the channel count.

Module

XNX25IPI

Procedure name

None.

EZB2130E**Link reserved channel count missing or not numeric**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set that had a missing or nonnumeric reserved channel count. The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the reserved channel count. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Link definition.

Module

XNX25IPI

Procedure name

None.

EZB2131E**Link reserved channel count not in range 1..LCC**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set with an incorrect reserved channel count. The count should be between 1 and the number of logical channels that have been defined. The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the reserved channel count. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Link definition.

Module

XNX25IPI

Procedure name

None.

EZB2132E**Link data network code missing**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set that omitted a data network identifier code (DNIC). DNICs should be specified for all networks (use DDN for DDN nets). The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Complete the Link entry. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Link definition.

Module

XNX25IPI

Procedure name

None.

EZB2133E**Data network identifier code not decimal**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set that specified a nondecimal data network identifier code (DNIC). The DNIC should be decimal. The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the DNIC number. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Link definition.

Module

XNX25IPI

Procedure name

None.

EZB2134E**Link DTE address not decimal**

Explanation

X25IPI encountered a Link statement in its X25IPI configuration data set that contained a nondecimal DTE address. The Link entry is discarded; further errors can result.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the DTE address.

Module

XNX25IPI

Procedure name

None.

EZB2135E**Altlink record not preceded by a Link record**

Explanation

The X25 server is processing an ALTLINK record that was not preceded by a LINK record in the configuration data set.

System action

X25 ignores the ALTLINK configuration record.

Operator response

Correct the configuration data set by either removing the ALTLINK statement or adding the correct LINK statement preceding the ALTLINK statement. For more information about the ALTLINK and LINK statements, see [z/OS Communications Server: IP Configuration Guide](#).

System programmer response

None.

Module

XNX25IPI

Procedure name

STRTALTL

EZB2140E	Dest record not preceded by Link record
-----------------	--

Explanation

X25IPI encountered a Dest record in its X25IPI configuration data set before any Link record. The Dest record should follow the corresponding Link record in the X25IPI configuration data set. The Dest entry is skipped.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Move the Dest record after the corresponding Link record.

Module

XNX25IPI

Procedure name

None.

EZB2141E	Dest IP address missing
-----------------	--------------------------------

Explanation

X25IPI encountered a Dest record in its X25IPI configuration data set that did not specify an IP address. The Dest entry is discarded.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Complete the Dest entry. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Dest record.

Module

XNX25IPI

Procedure name

None.

EZB2142E**Dest IP address must be decimal**

Explanation

X25IPI encountered a Dest record in its X25IPI configuration data set specifying a nondecimal destination address. The destination address should be in dotted-decimal form. The Dest entry is discarded.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the IP address. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Dest record.

Module

XNX25IPI

Procedure name

None.

EZB2143E**Dest DTE address missing**

Explanation

X25IPI encountered a Dest record in its X25IPI configuration data set, which omitted the destination X.25 DTE address specification. The destination X.25 DTE address specification is required on non-DDN networks. The Dest entry is discarded.

System action

Operator response

Tell the system programmer about the error.

System programmer response

Complete the Dest record with the X.25 DTE address. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Dest record.

Module

XNX25IPI

Procedure name

None.

EZB2144E **Dest DTE address must be decimal**

Explanation

X25IPI encountered a Dest record in its X25IPI configuration data set that had a nondecimal destination X.25 DTE address specified. The destination X.25 DTE address should be decimal. The Dest entry is discarded.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the DTE address.

Module

XNX25IPI

Procedure name

None.

EZB2145E **Dest call user data must be hexadecimal**

Explanation

X25IPI encountered a Dest record in its X25IPI configuration data set specifying nonhexadecimal call user data (CUD) protocol ID. The CUD should be hexadecimal. The Dest entry is discarded.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the call user data.

Module

XNX25IPI

Procedure name

None.

EZB2146E**Dest facilities data must be hexadecimal**

Explanation

The X25 server is processing the facilities field on a DEST statement. The field contained a non-hexadecimal character.

System action

X25 discards this record and continues.

Operator response

Correct the configuration data set by correcting the DEST facilities field. For more information about the configuration data set statements, see [z/OS Communications Server: IP Configuration Reference](#).

System programmer response

None.

Module

XNX25IPI

Procedure name

STRTDEST

EZB2150E**Datagram size limit missing or not numeric**

Explanation

X25IPI encountered a Buffers record in its X25IPI configuration data set that had a missing or nonnumeric buffer size specification. The Buffers record is ignored. The default values are applied.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Complete the Buffers record with the datagram size limit. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Dest record.

Module

XNX25IPI

Procedure name

None.

EZB2151E	Datagram size limit not in range 576...2048
-----------------	--

Explanation

X25IPI encountered a Buffers record in its X25IPI configuration data set with an incorrect buffer size specification. The buffer size should be in the range 576–2048. The Buffers record is ignored. The default values are applied.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the datagram size limit.

Module

XNX25IPI

Procedure name

None.

EZB2152E	Extra buffer count missing or not numeric
-----------------	--

Explanation

X25IPI encountered a Buffers record in its X25IPI configuration data set that had a missing or nonnumeric buffer count field. The extra buffer count is ignored.

System action

The extra buffer count is ignored. Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the buffer count.

Module

XNX25IPI

Procedure name

None.

EZB2153E**VC send queue limit missing or not numeric**

Explanation

X25IPI encountered a Buffers record in its X25IPI configuration data set that had a missing or nonnumeric send queue limit. The send queue limit defaults to 8.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the queue limit.

Module

XNX25IPI

Procedure name

None.

EZB2155E**Inactivity timeout missing or not numeric**

Explanation

X25IPI encountered a Timers record in its X25IPI configuration data set that had a missing or nonnumeric inactivity time-out value. The Timers record is ignored. The default values are applied.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Complete the Timers record with the inactivity time-out. See [z/OS Communications Server: IP Configuration Reference](#) for the format of the Dest record.

Module

XNX25IPI

Procedure name

None.

EZB2156E**Minimum call timer missing or not numeric****Explanation**

X25IPI encountered a Timer record in its X25IPI configuration data set that had a missing or nonnumeric minimum time field. This Timer record is ignored. The minimum call time defaults to 60 seconds.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the minimum call time.

Module

XNX25IPI

Procedure name

None.

EZB2160E**Options record not preceded by Link record****Explanation**

X25IPI encountered an Options record in its X25IPI configuration data set before any Link record. The Options record should follow the associated Link record. The Options record is ignored.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Move the Options record after the corresponding Link record.

Module

XNX25IPI

Procedure name

None.

EZB2161E**Option name not recognized *name*****Explanation**

X25IPI encountered an Options record in its X25IPI configuration data set with an unrecognized option name. The remainder of the Options record is skipped.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the option name. See [z/OS Communications Server: IP Configuration Guide](#) for the format of the Options record.

Module

XNX25IPI

Procedure name

None.

EZB2162E**Option packet size missing or not numeric****Explanation**

X25IPI has encountered an Options statement in its X25IPI configuration data set (DD statement X25IPI) that has a missing or nonnumeric packet size specification. The remainder of the Options record is skipped.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the packet size.

Module

XNX25IPI

Procedure name

None.

EZB2163E**Option packet size unacceptable**

Explanation

X25IPI encountered an Options record in its X25IPI configuration data set that specified an unacceptable packet size. The size should be 32, 64, 128, 256, 512, 1024, 2048, or 4096. The remainder of the Options record is skipped.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the packet size.

Module

XNX25IPI

Procedure name

None.

EZB2164E**Option window size missing or not numeric**

Explanation

XNX25IPI encountered an Options statement in its X25IPI configuration data set that had a missing or nonnumeric window size. The remainder of the Options record is skipped.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the window size.

Module

XNX25IPI

Procedure name

None.

EZB2165E**Option window size not in range 1..7 or 1..127**

Explanation

XNX25IPI encountered an Options statement in its X25IPI configuration data set that specified an incorrect window size. The window size should be in the range 1–7 or 1–127. The remainder of the Options record is skipped.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the window size.

Module

XNX25IPI

Procedure name

None.

EZB2166E**Option call user data missing or not hexadecimal**

Explanation

The X25 server is processing an OPTION CALldata statement. The statement is missing the call user data, or the call user data specified was not hexadecimal.

System action

X25 discards this record and continues.

Operator response

Correct the configuration data set by correcting the CALldata option. For more information about the configuration data set statements, see [z/OS Communications Server: IP Configuration Guide](#).

System programmer response

None.

Module

XNX25IPI

Procedure name

STRTOPTN

EZB2167E**Option facilities data must be hexadecimal**

Explanation

The X25 server is processing an OPTION FACILITIES statement. The statement is missing the facilities data, or the facilities data specified was not hexadecimal.

System action

X25 discards this record and continues.

Operator response

Correct the configuration data set by correcting the FACILITIES option. For more information about the configuration data set statements, see [z/OS Communications Server: IP Configuration Reference](#).

System programmer response

None.

Module

XNX25IPI

Procedure name

STRTOPTN

EZB2180E**FAST record not preceded by a Link record**

Explanation

The X25 server is processing the FAST statement in the configuration data set. The FAST statement was not preceded by a LINK statement.

System action

XNX25IPI ignores the FAST statement.

Operator response

Correct the configuration data set by either removing the FAST statement or preceding the FAST statement with a LINK statement. Rerun the TCPIPX25 catalog procedure. For more information about the configuration data set statements, see [z/OS Communications Server: IP Configuration Guide](#).

System programmer response

None.

Module

XNX25IPI

Procedure name

STRTFAST

EZB2181E**FAST connect LU name prefix missing**

Explanation

The X25 server is processing the FAST statement in the configuration data set. The FAST statement did not contain a VC LU prefix.

System action

XNX25IPI ignores the FAST statement.

Operator response

Correct the configuration data set by adding the prefix to the FAST statement. Rerun the TCPIPX25 catalog procedure. For more information about the configuration data set statements, see [z/OS Communications Server: IP Configuration Guide](#).

System programmer response

None.

Module

XNX25IPI

Procedure name

STRTFast

EZB2182E	FAST connect LU name too long
-----------------	--------------------------------------

Explanation

The X25 server is processing the FAST statement in the configuration data set. The FAST statement contained a VC LU prefix that exceeded eight characters.

System action

XNX25IPI ignores the FAST statement.

Operator response

Correct the configuration data set by correcting the prefix in the FAST statement. Rerun the TCPIPX25 catalog procedure. For more information about the configuration data set statements, see [z/OS Communications Server: IP Configuration Guide](#).

System programmer response

None.

Module

XNX25IPI

Procedure name

STRTFast

EZB2183E	FAST connect LU name suffix unacceptable
-----------------	---

Explanation

The X25 server is processing the FAST statement in the configuration data set. The FAST statement contained a suffix that had an incorrect character. The suffix should be decimal or hexadecimal, as appropriate to the specified FAST connect numbering scheme.

System action

Remaining fast-connect LU names will not be generated.

Operator response

Correct the configuration data set by correcting the suffix in the FAST statement. Rerun the TCPIPX25 catalog procedure. For more information about the configuration data set statements, see [z/OS Communications Server: IP Configuration Guide](#).

System programmer response

None.

Module

XNX25IPI

Procedure name

STRTFast

EZB2184E**FAST connect LU name suffix overflow**

Explanation

The X25 server is processing the FAST statement in the configuration data set. The FAST statement contains a suffix that has too many characters. The LU name suffix generated for a fast-connect virtual circuit exceeds the available field width.

System action

Remaining fast-connect LU names will not be generated.

Operator response

Correct the configuration data set by correcting the suffix in the FAST statement. Rerun the TCPIPX25 catalog procedure. For more information about the configuration data set statements, see [z/OS Communications Server: IP Configuration Guide](#).

System programmer response

None.

Module

XNX25IPI

Procedure name

STRTFast

EZB2201I**MCH luname OPNDST complete**

Explanation

X25IPI has successfully established a VTAM session with the NPSI MCH LU.

System action

The X25 server continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

MCHOPNDC

EZB2202I

MCH *lu*name restart packet sent

Explanation

The X25 server has sent a restart packet to a multichannel link (MCH).

System action

The contents of the restart packet are displayed in subsequent messages.

Operator response

None.

System programmer response

Use the data in problem determination.

Module

XNX25IPI

Procedure name

MCHOPNDC

EZB2203I

MCH *lu* restarting

Explanation

An X.25 restart exchange was started on the NPSI MCH.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2205E	MCH <i>lu</i> open failed
-----------------	----------------------------------

Explanation

X25IPI encountered an error opening the indicated NPSI MCH. This message is preceded by the message EZB2407E or EZB2411E reporting a VTAM error code. The MCH LU is enabled for automatic recovery by LOGAPPL, or for manual restart.

System action

Processing continues.

Operator response

Activate the NPSI MCH in VTAM, and use the X25IPI RESTART command to reacquire the MCH.

System programmer response

Use the VTAM error code from the EZB2407E or EZB2411E message to determine why the MCH OPNDST was unsuccessful.

Module

XNX25IPI

Procedure name

None.

EZB2206E	MCH <i>lu</i> OPNDST did not complete
-----------------	--

Explanation

A VTAM OPNDST request on a NPSI MCH LU was posted complete, but the NIB is not marked open. The contents of the session data area (SDA) for this MCH are dumped. The MCH LU is enabled for automatic recovery by LOGAPPL, or for manual restart.

System action

Processing continues.

Operator response

Activate the NPSI MCH in VTAM, and use the X25IPI RESTART command to reacquire the MCH.

System programmer response

Determine the state of the NPSI MCH LU using the VTAM DISPLAY command.

Module

XNX25IPI

Procedure name

None.

EZB2210I	MCH <i>luname</i> packet level ready
-----------------	---

Explanation

The X25 server has made a multichannel link (MCH) available for virtual circuit connections.

System action

XNX25IPI continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

MCHOPNDC

EZB2211I	MCH <i>luname</i> packet received
-----------------	--

Explanation

The X25 server has received a packet from a multichannel link (MCH).

System action

The contents of the packet are displayed in subsequent messages.

Operator response

None.

System programmer response

Use the data in problem determination.

Module

XNX25IPI

Procedure name

MCHRSTIP

EZB2212I**MCH lu discarded packet during restart****Explanation**

X25IPI received an incorrect packet while restarting this MCH. The incorrect packet is dumped and discarded.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2213I**MCH lu restart indication, cause=value diagnostic=value****Explanation**

X25IPI received an X.25 restart indication for this MCH during the restart procedure with the indicated cause and diagnostic bytes. The X.25 network interface has been reinitialized. Virtual circuit connections on the MCH are closed, and the X.25 restart procedure is used to place the MCH back in operation. See *X.25 Network Control Program Packet Switching Interface Diagnosis, Customization, and Tuning* for a list of X.25 cause and diagnostic codes. See the provider of the X.25 network service for documentation that lists additional diagnostic codes.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2214I**MCH *lu* restart confirmation****Explanation**

X25IPI received a restart confirmation for this MCH. The MCH is marked ready for new connections.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2215I**MCH *lu* restart complete****Explanation**

X25IPI has completed terminating virtual circuits on an MCH undergoing restart. An X.25 restart confirmation is sent to complete the restart procedure.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2221I**MCH *lu* restart indication, cause=*cause*, diagnostic=*diagnostic***

Explanation

X25IPI received a restart indication on this MCH with the indicated cause and diagnostic bytes. The X.25 network interface has been reinitialized. Virtual circuit connections on the MCH are closed, and the X.25 restart procedure is used to place the MCH back in operation. See *X.25 Network Control Program Packet Switching Interface Diagnosis, Customization, and Tuning* for a list of X.25 cause and diagnostic codes. See the provider of the X.25 network service for documentation that lists additional diagnostic codes.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2222I **MCH lu restart confirm packet sent**

Explanation

X25IPI transmitted a restart confirmation packet for this MCH. The restart confirmation packet is dumped.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2223I **MCH luname request packet sent**

Explanation

The X25 server has sent a request packet from a multichannel link (MCH).

System action

The contents of the restart packet are displayed in subsequent messages.

Operator response

None.

System programmer response

Use the data in problem determination.

Module

XNX25IPI

Procedure name

MCSTSRSR

EZB2224I**MCH *lu* restarting**

Explanation

X25IPI is restarting the indicated MCH.

System action

X25IPI waits to receive a restart confirmation on the MCH.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2230I**MCH *luname* packet received**

Explanation

The X25 server has received a packet from a multichannel link (MCH).

System action

The contents of the restart packet are displayed in subsequent messages.

Operator response

None.

System programmer response

Use the data in problem determination.

Module

XNX25IPI

Procedure name

MCHRDYIP

EZB2231I**MCH *lu* orphan packet received**

Explanation

X25IPI received a packet for which it could find no associated connection. An X.25 clear request is sent on the virtual circuit.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2232I**MCH *lu* diagnostic packet**

Explanation

X25IPI received an X.25 diagnostic packet on this MCH. The diagnostic packet is dumped and discarded.

System action

Processing continues.

Operator response

None.

System programmer response

Use the diagnostic packet to obtain additional information about X.25 network errors.

Module

XNX25IPI

Procedure name

None.

EZB2233I

MCH *lu* clear request sent

Explanation

X25IPI sent a clear request on the indicated MCH to recover from an error situation.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2234E

MCH *lu* no free path available for incoming call MCH *lu* check number of logical channels on Link record

Explanation

X25IPI received an incoming call, but has no session areas available to handle it. This indicates that there are more virtual circuits subscribed than were specified on the LINK record in the X25IPI configuration data set. The incoming call is cleared.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Increase the virtual circuit count on the Link record to match the number of virtual circuits defined in the NPSI configuration.

Module

XNX25IPI

Procedure name

None.

EZB2235W**MCH *lu* orphan packet discarded****Explanation**

X25IPI received a packet that it could not associate with any connection. The packet is dumped and discarded.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the type of X.25 packet from the dump. A clear confirmation (X'17') can be discarded harmlessly.

Module

XNX25IPI

Procedure name

None.

EZB2236E**MCH *lu* unrecognized packet received****Explanation**

X25IPI did not recognize the type code in a packet received from NPSI. The unrecognized packet is dumped and discarded.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the packet type from the dump; contact IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2250I**MCH *lu* terminating**

Explanation

X25IPI is terminating this MCH session in response to an error condition or a HALT command.

System action

Connections on virtual circuits associated with the MCH are terminated, and the MCH session is closed.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2251I**MCH *lu* closed**

Explanation

X25IPI received a CLSDST completion indication for this MCH, indicating that this MCH has closed.

System action

The MCH LU is enabled for automatic recovery by LOGAPPL, or for manual restart.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2252I**MCH *luname* logon**

Explanation

The multichannel link (MCH) was inactive and a logon notification was received. XNX25IPI opens a VTAM session.

System action

XNX25IPI continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

MCHRDYIP

EZB2280E**MCH lu session loss code code****Explanation**

X25IPI received the indicated MCH status change code while the MCH was not operational. See message EZB2285E for the loss codes.

System action

The MCH LU is enabled for automatic recovery by LOGAPPL, or for manual restart.

Operator response

Notify the system programmer of the error.

System programmer response

Manually restart X25IPI, if necessary.

Module

XNX25IPI

Procedure name

None.

EZB2281I**VC vc packet discarded on failed session****Explanation**

X25IPI discarded a packet received after a session was closed.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2282E**MCH lu unexpected request completion**

Explanation

X25IPI received a VTAM request completion notification for this MCH. This indicates a program error, because MCH sends are done synchronously. The notification is ignored.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Contact IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2283I**MCH lu DATE error report command=*command* error=*error***

Explanation

X25IPI received a NPSI Dedicated Access to X.25 Transport Extension (DATE) error report for the indicated command and error. See *X.25 Network Control Program Packet Switching Interface Host Programming* for the error codes.

System action

X25IPI attempts to recover from the error.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2284E **MCH lu DATE error report command=command error=error**

Explanation

X25IPI encountered a DATE error because of an incorrect logical channel number. X25IPI discards the error indication. See *X.25 Network Control Program Packet Switching Interface Host Programming* for the error codes.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2285E **MCH lu session loss code code**

Explanation

X25IPI received a session status notification with the indicated session loss code for this MCH.

Code

Description

Less than 50

VTAM LOSTERM exit codes

50

VTAM SCIP exit UNBIND

64000

VTAM NS exit CLEANUP

64001

VTAM NS exit session initiation failure

64002

VTAM NS exit session initiation negative response

The MCH LU is enabled for automatic recovery by LOGAPPL, or for manual restart.

System action

Processing continues.

Operator response

Reactivate the NPSI MCH in VTAM. Use the X25IPI RESTART command to reacquire the MCH LU.

System programmer response

Use the VTAM error code to determine the reason why the session was unsuccessful.

Module

XNX25IPI

Procedure name

None.

EZB2301I	VC ID incoming call from <i>address</i> user data <i>value</i>
-----------------	---

Explanation

X25IPI has received an incoming call on this virtual circuit from the indicated address with the indicated user data (protocol ID). The call is accepted or refused.

System action

Processing continues.

Operator response

None.

System programmer response

Use the address to determine the source of the connection.

Module

XNX25IPI

Procedure name

None.

EZB2302I	VC vc call accept packet sent
-----------------	--------------------------------------

Explanation

X25IPI accepted an incoming call on this virtual circuit.

System action

The contents of the X.25 call accept packet are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCINCOM

EZB2304W**VC vc incoming call cleared: caller not known**

Explanation

X25IPI received a call on this virtual circuit from an address not present in the Dest entries for the associated MCH. The incoming call is cleared.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the identity of the remote system initiating the call request, and add the address to the Dest list if the connection is authorized. The X.25 address of the calling system was noted in the preceding EZB2301I message for the VC ID.

Module

XNX25IPI

Procedure name

None.

EZB2305W**VC vc incoming call cleared: draining**

Explanation

X25IPI cleared an incoming call because a VTAM HALT request has been issued to end communication. Incoming calls are refused once the VTAM HALT command is issued.

System action

Processing continues.

Operator response

Shutdown and restart X25IPI when VTAM is restarted.

System programmer response

Assist the user as necessary.

Module

XNX25IPI

Procedure name

None.

EZB2306E**VC vc incoming call cleared: reason**

Explanation

X25IPI cleared an incoming call on this virtual circuit because of an error in the format of the X.25 call request packet:

- Called address is not decimal.
- Calling address is not decimal.
- CUD field is too long.
- CUD field not acceptable.
- Duplicate address.
- Facilities not acceptable.
- Reverse charging has not been enabled on the associated link.
- Reverse charging refused.
- Reverse charging was specified in the call.
- Reverse charging has not been enabled on the associated link.
- The address duplicated that of another connection.

The incoming call is cleared.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the remote system that is generating the incorrect calls. The X.25 address of the calling system was noted in the preceding EZB2301I message for the VC ID.

Module

XNX25IPI

Procedure name

None.

EZB2307I**VC vc clear request packet sent**

Explanation

X25IPI refused an incoming call on this virtual circuit.

System action

The contents of the X.25 clear request packet are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCINCOM

EZB2308I

VC vc finished sending call confirm

Explanation

A VTAM OPNDST call was accepted and the NPSI SEND completed.

System action

XNX25IPI continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCACPTSC

EZB2310I

VC vc outgoing call to address

Explanation

X25IPI is placing an outgoing call to this indicated address on this virtual circuit. Queued datagrams are sent on the connection after the call is accepted by the remote system.

System action

Processing continues.

Operator response

None.

System programmer response

Use the address to determine the destination of the connection.

Module

XNX25IPI

Procedure name

None.

EZB2311I **VC vc call request packet sent****Explanation**

X25IPI placed an outgoing call on this virtual circuit.

System action

The contents of the X.25 call request packet are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCCLLFCL

EZB2312I **VC vc call request sent****Explanation**

X25IPI placed an outgoing call request on this virtual circuit. The X.25 NCP Packet Switching Interface (NPSI) SEND is complete.

System action

XNX25IPI continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCCALLSC

EZB2313W	VC vc call timer expired
-----------------	---------------------------------

Explanation

The remote system has not responded to a call request in 200 seconds. The call is ended, and queued datagrams are discarded.

System action

Processing continues.

Operator response

Check the status of the remote system and the X.25 network. The X.25 address of the calling system was noted in the preceding EZB2310I message for the VC ID.

System programmer response

Assist the user as necessary.

Module

XNX25IPI

Procedure name

None.

EZB2314I	VC vc call accepted by <i>address</i> user data <i>value</i>
-----------------	---

Explanation

An outgoing call on this virtual circuit was accepted by the remote system at the indicated address with the indicated user data (protocol specifier). Queued datagrams are sent.

System action

Processing continues.

Operator response

None.

System programmer response

Use the address to determine the destination of the connection.

Module

XNX25IPI

Procedure name

None.

EZB2315I **VC vc retrying call with packet size *size***

Explanation

The packet size for this virtual circuit was reduced by the network or responder. NPSI DATE cannot handle this negotiation, thus the call is cleared and placed again with the smaller packet size.

System action

Processing continues.

Operator response

Tell the system programmer if this message recurs frequently.

System programmer response

Add or change an OPTIONS PACKETSZ entry on the associated Link specifying the smallest packet size used by other systems on the X.25 network. Consider using the NPSI GATE facility rather than DATE. GATE can handle the reduced packet size without the call to be repeated.

Module

XNX25IPI

Procedure name

None.

EZB2316E **VC vc outgoing call cleared: *reason***

Explanation

X25IPI cleared an outgoing call on this virtual circuit because of an error in one of the following formats:

- The X.25 call accept packet.
- Accepting user data is too long.
- Called address is not decimal.
- Calling address is not decimal.
- Facilities not acceptable.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the remote system that is generating the incorrect calls. The X.25 address of the called system was noted in the preceding EZB2310I message for the VC ID.

Module

XNX25IPI

Procedure name

None.

EZB2317I	VC vc call to address refused, cause=cause diagnostic=diagnostic
-----------------	---

Explanation

An outgoing call on this virtual circuit to the indicated address was refused by the X.25 network, with the indicated cause and diagnostic bytes. Datagrams queued for the remote system are discarded. A new call is attempted when the TCP acknowledgment timer expires, or when a new connection is requested to the destination. TCP connections to the destinations handled by the remote system are unsuccessful if calls are not accepted in the initial connection time-out. See *X.25 Network Control Program Packet Switching Interface Diagnosis, Customization, and Tuning* for X.25 cause and diagnostic codes. See the X.25 network service provider for documentation about additional diagnostic codes.

System action

Processing continues.

Operator response

Verify that the remote system and the X.25 network are operational.

System programmer response

Assist the user as necessary.

Module

XNX25IPI

Procedure name

None.

EZB2320I	VC vc NPSI logon LU lu
-----------------	-------------------------------

Explanation

NPSI generated a VTAM session logon from the indicated LU for the virtual circuit. The NPSI LU logon is accepted.

System action

Processing continues.

Operator response

None.

System programmer response

Use the LU name for NPSI problem determination.

Module

XNX25IPI

Procedure name

None.

EZB2321E	VC vc session loss code
-----------------	--------------------------------

Explanation

X25IPI received the indicated virtual circuit (VC) status change code while the virtual circuit (VC) was not operational.

System action

The virtual circuit (VC) LU is enabled for automatic recovery by LOGAPPL or for manual restart.

Operator response

Notify the system programmer of the error.

System programmer response

Restart XNX25IPI if necessary.

Module

XNX25IPI

Procedure name

VCLOGON

EZB2322I	VC vc OPNDST complete
-----------------	------------------------------

Explanation

A VTAM OPNDST request on a NPSI virtual circuit (VC) LU was posted complete.

System action

X25IPI continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCOPENC

EZB2323E	VC vc OPNDST did not complete
-----------------	--------------------------------------

Explanation

A VTAM OPNDST request on a NPSI VC LU was posted complete, but the NIB is not marked open. The contents of the session data area (SDA) for this VC are dumped. The virtual circuit call is cleared.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the state of the NPSI VC LU using the VTAM DISPLAY command.

Module

XNX25IPI

Procedure name

None.

EZB2324I	VC vc LU lu ready
-----------------	--------------------------

Explanation

The virtual circuit LU session is ready for data transfer.

System action

TCPIP continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2325I**VC vc facilities: *facilities***

Explanation

A list of facilities for this virtual circuit follows. The following are the facilities codes that can be noted:

Codes

Description

pktpacket

The noted packet size is used

precedencepreced

The noted DDN precedence is applied

priority

Priority handling and charging is applied

revchg

Reverse charging is applied

standard

DDN standard service is used

wdwindow

The noted window size is used

The noted facilities are applied to the connection.

System action

Processing continues.

Operator response

None.

System programmer response

Use the information to determine the X.25 network facilities being used on the connection.

Module

XNX25IPI

Procedure name

None.

EZB2326E**VC vc facilities field unacceptable at offset *offset***

Explanation

X25IPI encountered an incorrect X.25 call facilities field from a remote system for this virtual circuit. The X.25 call facilities field is dumped, and the call is cleared.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the remote system that is generating the incorrect facilities. The X.25 address of the remote system was noted in the preceding EZB2301I or EZB2310I message for the VC ID.

Module

XNX25IPI

Procedure name

None.

EZB2330I **VC vc call complete**

Explanation

A VTAM OPNDST request on a NPSI virtual circuit (VC) LU was posted complete.

System action

X25IPI continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

MCHRDYIP

EZB2331I **VC vc data sent**

Explanation

X25IPI has sent a datagram to the X.25 NCP Packet Switching Interface (NPSI).

System action

The contents of the X.25 data packet sequence are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCLOGON

EZB2332I	VC vc data received
-----------------	----------------------------

Explanation

X25IPI has received a data packet that contained an IP datagram.

System action

The contents of the X.25 data packet sequence are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCRI PDT

EZB2333I	VC vc packet received
-----------------	------------------------------

Explanation

X25IPI has received a General Access To X.25 Transport Extension (GATE) control packet on this virtual circuit (VC).

System action

The contents of the control packet are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCRIPDT

EZB2334E	VC vc oversize data packet received, length=<i>length</i>
-----------------	--

Explanation

A datagram was received on this virtual circuit that had a length exceeding the buffer size specified in the X25IPI configuration data set. Either the local or remote system is misconfigured. The packet is dumped, and the connection is cleared.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Check the buffer size on the Buffers record in the X25IPI configuration data set. The buffer size should be large enough to hold the maximum IP datagram permitted by the usage agreements of the X.25 network. The X.25 address of the remote system was noted in the preceding EZB2301I or EZB2310I message for the VC ID.

Module

XNX25IPI

Procedure name

None.

EZB2335E	VC vc unrecognized packet received
-----------------	---

Explanation

X25IPI did not recognize the type code in a packet received from NPSI GATE. The unrecognized packet is dumped and discarded.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the packet type from the dump; contact IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2336I **VC vc inactivity timer expired**

Explanation

The inactivity time for this virtual circuit passed with no data transferred. The virtual circuit connection is closed.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2340I **VC vc call reset, cause=cause diagnostic=diagnostic**

Explanation

A call reset was received for this virtual circuit with the indicated cause and diagnostic bytes. The reset is confirmed, and data transfer continues. See *X.25 Network Control Program Packet Switching Interface Diagnosis, Customization, and Tuning* for a list of X.25 cause and diagnostic codes. See the provider of the X.25 network service for documentation that lists additional diagnostic codes.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2341I**VC vc reset collision****Explanation**

A reset collision occurred on this virtual circuit. Data transfer resumes.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2342I**VC vc reset confirmed****Explanation**

A reset on this virtual circuit was confirmed by the remote system. Data transfer resumes on the virtual circuit.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2343W**VC vc qualified data packet discarded****Explanation**

A qualified data packet was received on an IP connection. Qualified data packets are not specified for use on IP connections. The qualified data packet is dumped and discarded.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the remote system that is sending qualified data packets. The X.25 address of the remote system was noted in the preceding EZB2301I or EZB2310I message for the VC ID.

Module

XNX25IPI

Procedure name

None.

EZB2344W**VC vc interrupt indication received****Explanation**

An interrupt indication was received for this virtual circuit. Interrupt packets are not specified for use on IP connections. The interrupt packet is dumped, and an interrupt response is sent.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Correct the remote system that is sending interrupt packets. The X.25 address of the remote system was noted in the preceding EZB2301I or EZB2310I message for the VC ID.

Module

XNX25IPI

Procedure name

None.

EZB2345E**VC vc interrupt confirmed**

Explanation

An interrupt was confirmed for this virtual circuit. Interrupt packets are not specified for use on IP connections. The virtual circuit is reset, and data transfer continues.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Contact IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2346I	VC vc reset confirmation packet sent
----------	--------------------------------------

Explanation

A reset packet was received and X25IPI has sent a reset confirmation packet on this virtual circuit (VC).

System action

The contents of the X.25 reset confirmation packet are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCRI PDT

EZB2347I	VC vc interrupt confirm packet sent
----------	-------------------------------------

Explanation

An interrupt packet was received and X25IPI has sent an interrupt confirmation packet on this virtual circuit (VC).

System action

The contents of the X.25 interrupt confirmation packet are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCCONF1

EZB2348I **VC vc reset request packet sent**

Explanation

X25IPI has sent a reset packet on this virtual circuit (VC) to reset the connection.

System action

The contents of the X.25 reset request packet are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCCONF1

EZB2350I **VC vc call cleared, cause=cause diagnostic=diagnostic**

Explanation

A call was cleared on this virtual circuit with the indicated cause and diagnostic bytes. A clear confirmation is sent, and the virtual circuit connection is closed. See *X.25 Network Control Program Packet Switching Interface Diagnosis, Customization, and Tuning* for a list of X.25 cause and diagnostic codes. See the provider of the X.25 network service for documentation that lists additional diagnostic codes.

System action

Processing continues.

Operator response

None.

System programmer response

Use the cause and diagnostic codes to determine the reason the call was cleared.

Module

XNX25IPI

Procedure name

None.

EZB2351I	VC vc connection terminated for <i>address</i>: sent <i>count</i> received <i>count</i> dropped <i>count</i>
-----------------	---

Explanation

The number of datagrams sent, received, and dropped on the virtual circuit to the remote system with the indicated X.25 address is shown when the connection is ended.

System action

The VC LU session is closed.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2352I	VC vc closed
-----------------	---------------------

Explanation

The call on the virtual circuit was ended. The virtual circuit is reused for new calls.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2353I	VC vc clear request packet sent
-----------------	--

Explanation

X25IPI has sent a clear packet on this virtual circuit (VC) to clear the connection. XNX25IPI is in the process of closing the connection.

System action

The contents of the X.25 clear request packet are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCCLROUT

EZB2354I	VC vc clear confirm packet sent
-----------------	--

Explanation

X25IPI has sent a clear confirmation packet on this virtual circuit (VC) for the clear request. XNX25IPI is in the process of closing the connection.

System action

The contents of the X.25 clear request packet are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCCLROUT

EZB2355I**VC vc close pending****Explanation**

A close of this virtual circuit is partially completed.

System action

X25IPI waits for the remaining close events to occur.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2356W**VC vc unable to clear GATE call in state P2****Explanation**

X25IPI needed to clear a NPSI GATE call while the call was pending. The NPSI GATE programming interface does not allow a call to be cleared in this state.

System action

X25IPI waits for action by the X.25 network.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the reason the X.25 network or remote system did not respond to the call request.

Module

XNX25IPI

Procedure name

None.

EZB2357E**VC vc clearing limit exceeded****Explanation**

No clear response was received from the remote system after four clear requests. The virtual circuit is marked as cleared.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the reason the X.25 network or remote system did not respond to the clear request.

Module

XNX25IPI

Procedure name

None.

EZB2358I**VC vc clear confirmed****Explanation**

The remote system responded to a clear request on this virtual circuit. Virtual circuit termination continues; message EZB2352I should follow.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2360I**VC vc closed LU**

Explanation

X25IPI has completed a VTAM CLSDST for a virtual circuit (VC) LU session.

System action

The X.25 server continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCCLOSRC

EZB2361W**VC vc clearing timer expired****Explanation**

The remote system did not respond to a clear request in 180 seconds. The clear request is retried 4 times.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the reason the remote system did not respond to the clear request.

Module

XNX25IPI

Procedure name

None.

EZB2362I**VC vc clear request packet sent****Explanation**

X25IPI has sent a clear packet on this virtual circuit (VC) to clear the connection. XNX25IPI is in the process of closing the connection.

System action

The contents of the X.25 clear request packet are displayed in subsequent messages.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCCLRTMR

EZB2363E VC vc clearing limit exceeded

Explanation

No clear response was received from the remote system after four clear requests. The virtual circuit is marked as cleared.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the reason the X.25 network or remote system did not respond to the clear request.

Module

XNX25IPI

Procedure name

None.

EZB2364I VC vc clear confirmation sent

Explanation

A clear request from the remote system was confirmed on this virtual circuit. Virtual circuit termination continues; message EZB2352I should follow.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2365I **VC vc clear sent****Explanation**

A clear request was sent on this virtual circuit. Virtual circuit termination continues; message EZB2352I should follow.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2366I **VC vc finished lu *luname* activity****Explanation**

X25IPI reports the completion of a pending VTAM request during virtual circuit (VC) closing.

System action

The X.25 server continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VCCLWTRC

EZB2367I VC vc reuse delay ended

Explanation

The timer expired for NPSI cleanup for this virtual circuit. A new call can now be made on this virtual circuit.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2368I VC vc retry busy call

Explanation

X25IPI tries a call again that previously received a busy indication from NPSI.

System action

Processing continues.

Operator response

If the error recurs, tell the system programmer about the error.

System programmer response

If the error recurs, check the number of virtual circuits specified on the Link record in the X25IPI configuration data set against the number defined in the NPSI configuration. Use the VTAM DISPLAY command to determine the state of the NPSI switched VC LUs.

Module

XNX25IPI

Procedure name

None.

EZB2370E**VC vc inactive: VTAM request completion REQ=*request*****Explanation**

A VTAM request has completed for this virtual circuit after the connection has ended.

System action

TCPIP continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2371E**VC vc inactive: session loss code *code*****Explanation**

X25IPI received a session status notification with the indicated session loss code for this virtual circuit after the connection was ended. The notification is ignored. See message EZB2383I for the loss codes.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2372I**VC vc inactive: session cleanup****Explanation**

Session cleanup is in progress for this inactive virtual circuit. The VC LU session is closed.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2373E**VC vc inactive: VTAM logon refused****Explanation**

A late logon from a NPSI VC LU was refused after a call was cleared. The logon is rejected.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2374I**VC vc packet discarded on dead connection**

Explanation

A packet was received on this virtual circuit after the connection was ended. The packet is discarded.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2381E

VC vc DATE error report command=*command* error=*error*

Explanation

X25IPI received a NPSI DATE error report for the indicated command and error. See *X.25 Network Control Program Packet Switching Interface Host Programming* for the error codes.

System action

X25IPI attempts to recover from the error.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2382E

VC vc GATE error report command=*command* error=*error*

Explanation

X25IPI received a NPSI GATE error report for the indicated command and error. See *X.25 Network Control Program Packet Switching Interface Host Programming* for the error codes.

System action

X25IPI attempts to recover from the error.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2383E**VC vc session loss code value on LU lu**

Explanation

A session loss status notification was received for this virtual circuit with the indicated loss code.

Code

Description

Less than 50

VTAM LOSTERM exit codes

50

VTAM SCIP exit UNBIND

64000

VTAM NS exit CLEANUP

64001

VTAM NS exit session initiation failure

64002

VTAM NS exit session initiation negative response

The virtual circuit connection is closed.

System action

Processing continues.

Operator response

None.

System programmer response

Use the VTAM error code to determine why the session was unsuccessful.

Module

XNX25IPI

Procedure name

None.

EZB2384I**VC vc discarded packet *packet* in state *state*****Explanation**

The indicated packet was discarded on this virtual circuit to accomplish error recovery. Virtual circuit error recovery is completed.

System action

Processing continues.

Operator response

See message EZB2021I VC for the call state codes.

System programmer response

Assist the user as necessary.

Module

XNX25IPI

Procedure name

None.

EZB2385E**VC vc received packet *packet* invalid in state *state*****Explanation**

The indicated received packet was incorrect for the current virtual circuit state. The virtual circuit is reset or cleared.

System action

Processing continues.

Operator response

See message EZB2021I VC for the call state codes. Tell the system programmer about the error.

System programmer response

Determine the reason the X.25 network or remote system sent the incorrect packet.

Module

XNX25IPI

Procedure name

None.

EZB2386E**VC vc discarded packet *packet* in state *state***

Explanation

The indicated packet for VC was discarded because the state was not valid for the current virtual circuit state. The virtual circuit *vc* is cleared.

System action

Processing continues.

Operator response

None.

System programmer response

Determine the reason the remote X.25 network sent the incorrect *state* value for the circuit.

Module

XNX25IPI

Procedure name

None.

EZB2401E VTAM GENCB failed, R15=*value* R0=*value*

Explanation

A VTAM GENCB call was unsuccessful with the indicated R15 and R0 values.

System action

X25IPI does not start.

Operator response

Tell the system programmer about the error.

System programmer response

Reassemble X25IPI with the most recent VTAM macro library.

Module

XNX25IPI

Procedure name

None.

EZB2402E VTAM ACB OPEN failed, R15=*value* ACBERFLG=*value*

Explanation

A VTAM OPEN request failed with the indicated R15 and ACBERFLG values.

System action

X25IPI does not start.

Operator response

Activate the X25IPI application in VTAM.

System programmer response

Use the VTAM error codes to determine why the VTAM ACB OPEN macro was unsuccessful. See [z/OS Communications Server: SNA Programming](#) where codes can be found.

Module

XNX25IPI

Procedure name

None.

EZB2403E	VTAM SETLOGON failed, RTNCD=<i>rc</i> FDB2=<i>value</i>
-----------------	--

Explanation

A VTAM SETLOGON request failed with the indicated return code and FDB2 values.

System action

Processing continues, but virtual circuit (VC) LU logons will fail.

Operator response

None.

System programmer response

Use the VTAM error code to determine the reason for the failure of the VTAM SETLOGON request.

Module

XNX25IPI

Procedure name

VTAMENAB

EZB2404E	VTAM SETLOGON QUIESCE failed, RTNCD=<i>rc</i> FDB2=<i>value</i>
-----------------	--

Explanation

A VTAM SETLOGON QUIESCE request failed with the indicated return code and FDB2 values.

System action

X25IPI termination continues.

Operator response

Tell the system programmer about the error.

System programmer response

Use the VTAM error codes to determine why the VTAM SETLOGON macro. See the [z/OS Communications Server: SNA Programming](#) where codes can be found.

Module

XNX25IPI

Procedure name

None.

EZB2405E	VTAM ACB CLOSE failed, R15=<i>value</i> ACBERFLG=<i>value</i>
-----------------	--

Explanation

A VTAM CLOSE request failed with the indicated return values.

System action

X25IPI termination continues.

Operator response

Tell the system programmer about the error.

System programmer response

Use the VTAM error codes to determine why the VTAM CLOSE macro was unsuccessful. See the [z/OS Communications Server: SNA Programming](#) where codes can be found.

Module

XNX25IPI

Procedure name

None.

EZB2406E	VTAM GENCB failed, R15=<i>value</i> R0=<i>value</i>
-----------------	--

Explanation

A VTAM GENCB call failed with the indicated R15 and R0 values.

System action

The X.25 server continues processing.

Operator response

Tell the system programmer about the error.

System programmer response

Reassemble X25IPI with the most recent VTAM macro library.

Module

XNX25IPI

Procedure name

VTAMSIN

EZB2407E	VTAM VTAM request lu failed, RTNCD=<i>rc</i> FDB2=<i>value</i>
-----------------	---

Explanation

The indicated VTAM request was unsuccessful with the indicated return code and FDB2 values. The virtual circuit can become unusable.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Use the VTAM error codes to determine why the VTAM request was unsuccessful. See the [z/OS Communications Server: SNA Programming](#) where codes can be found. Determine the state of the NPSI LU using the VTAM DISPLAY command. If all virtual circuits become unusable, HALT and restart the X25IPI application.

Module

XNX25IPI

Procedure name

None.

EZB2410I	VTAM request complete for <i>luname</i> REQ=<i>value</i>
-----------------	---

Explanation

X25IPI completed a VTAM request. See message EZB2411E for the request codes.

System action

The X.25 server continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

VTAMCHK

EZB2411E

**VTAM request failed for *lu* REQ=*request* RNTCD=*rc* FDB2=*value*
sense=*value* (*caller*)**

Explanation

The indicated VTAM request was unsuccessful with the indicated return code, FDB2, and sense values. The caller field specifies the routine that issued the request. The following are the request codes:

Request Code	Description
--------------	-------------

X'17'	OPNDST
-------	--------

X'1F'	CLSDST
-------	--------

X'22'	SEND
-------	------

X'23'	RECEIVE
-------	---------

System action

If the error occurred on a NPSI MCH session, the MCH is shut down. If the error occurred on a VC session, the connection is closed.

Operator response

If the error occurred on a NPSI MCH session, activate the NPSI MCH in VTAM and use the X25IPI RESTART command to reacquire the MCH.

System programmer response

Use the VTAM error codes to determine why the VTAM ACB OPEN macro was unsuccessful. See the [z/OS Communications Server: SNA Programming](#) where codes can be found.

Module

XNX25IPI

Procedure name

None.

EZB2420I

Logon exit refusing session

Explanation

XNX25IPI is refusing a logon session because:

- For an MCH with LOGAPPL coded, the MCH is not defined by a LINK entry, or the MCH is not in a state where a logon is expected

- The logon was not initiated by X.25 NPSI
 - A virtual circuit is not in a state where a logon is expected, possibly because a call request was unsuccessful.
- The NPSI LU session logon is refused.

System action

Processing continues.

Operator response

Notify the system programmer if the message is issued frequently, and connections are failing.

System programmer response

Check the source of the logons; determine why the call request was unsuccessful.

Module

XNX25IPI

Procedure name

None.

EZB2421E	Network services exit: Unrecognized request type
-----------------	---

Explanation

XNX25IPI received an unrecognized Network Services RU from VTAM. The following are the supported RU:

- Cleanup Session (X'810629')
- Notify (X'810620')
- NS Procedure Error (X'010604')

VTAM is notified that the NS RU was not handled.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Obtain a VTAM buffer trace to determine the Network Services RU type.

Module

XNX25IPI

Procedure name

None.

EZB2422I	Network services exit: Cleanup session notification posted
-----------------	---

Explanation

A VTAM Cleanup Session RU was received. The VTAM session is ended. A failure message for the MCH or virtual circuit (VC) session follows.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2423W**Network services exit: Session initiation failure notification posted**

Explanation

A VTAM Session initiation failure RU was received. The VTAM session is ended. A failure message for the MCH or VC session can follow.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2424T**Session control exit: Unrecognized or unexpected request type**

Explanation

An unexpected VTAM Session Control RU was received. ABEND code X'941' is displayed with this message.

System action

X25IPI abends.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the source of VTAM session control request. Submit the ABEND dump to IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2425I	Session control exit: UNBIND notification posted
-----------------	---

Explanation

A VTAM Session Control RU of type UNBIND was received. The VTAM session is ended. A failure message for the MCH or VC session can follow.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2431E	VTAM terminating, reason unknown
-----------------	---

Explanation

A VTAM Shutdown notification was received. The cause is unknown. This rules out a standard shutdown, HALT QUICK, INACT, or HALT CANCEL reason codes.

System action

X25IPI ends.

Operator response

Tell the system programmer about the error.

System programmer response

Determine the source of the Shutdown notification.

Module

NX25IPI

Procedure name

None.

EZB2432I	VTAM HALT issued, drain flag set
-----------------	---

Explanation

A VTAM HALT request was issued.

System action

X25IPI ends after current connections are closed. New connections are refused.

Operator response

Restart X25IPI, if appropriate, after VTAM resumes.

System programmer response

Assist the user as necessary.

Module

XNX25IPI

Procedure name

None.

EZB2433I	VTAM HALT QUICK or VARY INACT, <i>application</i> issued
-----------------	---

Explanation

A VTAM HALT QUICK or VARY INACT request was issued.

System action

X25IPI ends.

Operator response

Restart X25IPI, if appropriate, after VTAM resumes.

System programmer response

Assist the user as necessary.

Module

XNX25IPI

Procedure name

None.

EZB2434I**VTAM HALT CANCEL issued****Explanation**

A VTAM HALT CANCEL request was issued.

System action

X25IPI ends.

Operator response

Restart X25IPI, if appropriate, after VTAM resumes.

System programmer response

Assist the user as necessary.

Module

XNX25IPI

Procedure name

None.

EZB2453I**IP AS_userid path refused for userid *userid*, draining****Explanation**

A DLC connection from the TCPIP address space was refused because a VTAM HALT command had been issued.

System action

Processing continues.

Operator response

HALT and restart the X25IPI application when VTAM is restarted.

System programmer response

Assist the user as necessary.

Module

XNX25IPI

Procedure name

None.

EZB2460E**Destination address *address* not configured****Explanation**

An IP datagram was received from TCPIP for transmission to the indicated address, which is not listed in the Dest entries in the X25IPI configuration data set. The IP datagram is discarded.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Add a Dest record to the X25IPI configuration data set for the IP address or network. Check the BEGINROUTES entries in *hlq*.PROFILE.TCPIP for a misrouted network number.

Module

XNX25IPI

Procedure name

None.

EZB2462E**IP *AS_userid* rejected message: too long IP *AS_userid* rejected message: too short****Explanation**

A DLC message was received from the TCPIP address space which was too long or too short. The message is rejected.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Contact IBM software support services.

Module

XNX25IPI

Procedure name

None.

EZB2480I**IP *AS_id* disconnected: sent *count* received *count* dropped *count***

Explanation

The number of datagrams sent, received, and dropped on the DLC connection to the TCPIP address space are shown when the connection is terminated.

System action

X25IPI ends.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2491I **DLC AS *asname* path severed**

Explanation

The DLC connection to TCPIP has been severed, most likely because TCPIP is being terminated or the X25NPSI device has been STOPped.

System action

X25IPI exits.

Operator response

Restart X25IPI, if appropriate, after TCPIP is restarted.

System programmer response

None.

Module

XNX25IPI

Procedure name

IPRDYPN

EZB2492I **DLC AS *_path* accepted for userid *userid***

Explanation

A DLC connection from the TCPIP address space was accepted. IP datagrams are transferred.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

None.

EZB2493I	DLC received data
-----------------	--------------------------

Explanation

X25IPI displays the contents of an IP datagram received from TCPIP in subsequent messages.

System action

The X.25 server continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

IPRDYPN

EZB2494I	DLC send datagram length	<i>length</i>	<i>next offset</i>	<i>offset</i>
-----------------	---------------------------------	---------------	--------------------	---------------

Explanation

X25IPI displays the length of the datagram to be sent to TCPIP.

System action

The X.25 server continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

IPSENDG

EZB2495I	DLC send total length <i>length</i>
-----------------	--

Explanation

X25IPI displays the total length of IP datagrams to be sent to TCPIP.

System action

The X.25 server continues processing.

Operator response

None.

System programmer response

None.

Module

XNX25IPI

Procedure name

IPSENDG

EZB2496E	XNX25IUT failed: CSM storage problem
-----------------	---

Explanation

XNX25IUT interface returned a return code of 4. This indicates an error with CSM storage.

System action

X25IPI closes connection with TCPIP.

Operator response

Tell the system programmer about the error.

System programmer response

Check for correct installation of the MVS TCPIP product.

Module

XNX25IPI

Procedure name

None.

EZB2497E**DLC function failed: STAFD= reason**

Explanation

XNX25IUT interface returned a return code of 8. The indicated DLC function, issued by XNX25IPI, failed for the reason indicated in the STAFD reason field.

1

INIT

2

SEND

3

RECV

4

CLEAR

5

TERM

System action

The DLC connection is severed.

Operator response

Tell the system programmer.

System programmer response

Perform the action described in [z/OS Communications Server: IP and SNA Codes](#) for the indicated status code.

Module

XNX25IPI

Procedure name

None.

EZB2498E**XNX25IUT failed: Unexpected return code**

Explanation

XNX25IUT interface returned a return code other than 0, 4, or 8.

System action

Processing continues.

Operator response

Tell the system programmer about the error.

System programmer response

Contact IBM software support services.

Module

XNX25IPI

Procedure name

None.

Chapter 5. EZB3xxxx messages

EZB3000I *** Can't find initialize address for server *server*: *return_code*

Explanation

The local host was unable to find the address of the Domain Name Server. Without the Domain Name Server, the local host is unable to determine the addresses of other hosts on the network.

System action

TCPIP continues.

Operator response

Notify the system programmer of the problem.

System programmer response

Add the address of the Domain Name Server (NSINTERADDR) to the *hlq*.TCPIP.DATA data set. For more information about the *hlq*.TCPIP.DATA data set, see [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

NSLOOKUP

Procedure name

main

EZB3001I	Usage:
EZB3002I	nslookup [-opt ...] # interactive mode using default server
EZB3003I	nslookup [-opt ...] - server #interactive mode using default server
EZB3004I	nslookup [-opt ...] host #just look up 'host' using default server
EZB3005I	nslookup [-opt ...] host #just look up 'host' using 'server'

Explanation

These messages give the format and usage for the NSLOOKUP command. For more information about the NSLOOKUP command, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System action

TCPIP continues.

Operator response

None.

System programmer response

None.

Module

NSLOOKUP

Procedure name

Usage

EZB3006I

SetDefaultServer: invalid name: *name*

Explanation

The name specified for the default Domain Name Server does not correspond to a local host. The Domain Name Server is not initialized.

System action

TCPIP continues.

Operator response

Notify the system programmer of the problem.

System programmer response

Correct the default Domain Name Server name (NSINTERADDR) in the *hlq*.TCPIP.DATA data set. For more information about configuring the Domain Name Server, see [z/OS Communications Server: IP Configuration Reference](#).

Module

NSLOOKUP

Procedure name

SetDefaultServer

EZB3007I

***** Can't find address for server *server*: *reason***

Explanation

TCPIP was unable to change to another Domain Name Server because it could not find an address for the new Domain Name Server. The reason it could not find the address is displayed in the message.

System action

TCPIP continues.

Operator response

Notify the system programmer of the problem.

System programmer response

Respond as indicated by the *reason* portion of this message.

Module

NSLOOKUP

Procedure name

SetDefaultServer

EZB3008I

***** No query_type (query_abbrev.) records available for host**

Explanation

No information of the type requested is available for the indicated host.

System action

TCPIP continues.

Operator response

Send a PING to the indicated host to determine if it is reachable through the network. Check the SEZAINST data set to make sure that recursion has been requested. Recursion will allow the Domain Name Server for the local zone to communicate with other Domain Name Servers to determine the requested address. If the error persists, notify the system programmer. For more information about recursion, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

Make sure that the Domain Name Server is started and online. If necessary, update the address tables for the Domain Name Server to include the indicated host.

Module

NSLOOKUP

Procedure name

DoLookup

EZB3009I

***** Request to server timed-out**

Explanation

A request to the indicated server reached the end of its time to live. The request is not answered.

System action

TCPIP continues.

Operator response

Resubmit the request. If the error persists, notify the system programmer.

System programmer response

Check the indicated server to determine why it is not answering requests.

Module

NSLOOKUP

Procedure name

DoLookup

EZB3010I***** Server can't find *host*: *reason*****Explanation**

The Domain Name Server is unable to find an address for the indicated host. The reason is displayed in the message.

System action

TCPIP continues.

Operator response

Notify the system programmer of the problem.

System programmer response

Respond as indicated by the *reason* portion of the message.

Module

NSLOOKUP

Procedure name

DoLookup

EZB3011E***** Can't open *file* for writing****Explanation**

The Domain Name Server is unable to open a file to write the answer to a request. The request is not answered.

System action

TCPIP continues.

Operator response

Notify the system programmer of the error.

System programmer response

Make sure that the Domain Name Server has the correct write authority.

Module

NSLOOKUP

Procedure name

LookupHost, LookupHostWithServer

EZB3012I**> *request***

Explanation

This message is written to the output file. It echoes the request to the Domain Name Server that produced the output file.

System action

TCPIP continues.

Operator response

None.

System programmer response

None.

Module

NSLOOKUP

Procedure name

LookupHost, LookupHostWithServer

EZB3013W *** Can't find address for server *server*: *reason*

Explanation

The default Domain Name Server was unable to get information about the requested Domain Name Server. The reason for the error is displayed in the message. The request is not answered.

System action

TCPIP continues.

Operator response

Notify the system programmer of the error.

System programmer response

Respond as indicated by the *reason* portion of this message.

Module

NSLOOKUP

Procedure name

LookupHostWithServer

EZB3014E *** Invalid set command

Explanation

The SET subcommand, which is used to set or change the options for the NSLOOKUP command, was submitted with no associated option. The SET subcommand is not accepted.

System action

TCPIP continues.

Operator response

If the NSLOOKUP command was submitted in interactive mode, resubmit the command specifying a valid option after the SET subcommand. To accept the current options to the NSLOOKUP command, omit the SET subcommand. If the NSLOOKUP command was submitted from the *user_id*.NSLOOKUP.ENV data set, edit the data set, including a valid option after the SET subcommand to change the NSLOOKUP options, or deleting the SET subcommand to accept the current option settings. For more information about the SET subcommand, the options to the NSLOOKUP command, and the *user_id*.NSLOOKUP.ENV data set, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

Assist the user as necessary.

Module

NSLOOKUP

Procedure name

SetOption

EZB3015I **d2 mode disabled; still in debug mode**

Explanation

The *NO D2* option has been accepted, disabling the high-level tracing for the Domain Name Server. The server is still in debug mode.

System action

TCPIP continues.

Operator response

None.

System programmer response

None.

Module

NSLOOKUP

Procedure name

SetOption

EZB3016E **invalid port value: *port***

Explanation

The PORT option to the SET subcommand, which specifies the port to use when contacting the Domain Name Server, was submitted with an incorrect value for the port. The given value was either out of the range of valid ports, or the value of a port that is already assigned. The PORT option is not accepted.

System action

TCPIP continues.

Operator response

Resubmit the NSLOOK command, specifying a valid port in the PORT option to the SET subcommand. The Domain Name Server is a well-known service, and is allocated port 53. For more information about the NSLOOKUP command, its subcommands and options, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

Assist the user as necessary.

Module

NSLOOKUP

Procedure name

SetOption

EZB3017E	invalid retry value: <i>value</i>
-----------------	--

Explanation

The RETRY option to the SET subcommand of the NSLOOKUP command was submitted with an incorrect value. The NSLOOKUP command is not accepted. The RETRY option specifies the number of times a request is resent. If the RETRY option is set to 0, no requests are sent, resulting in the error message “no response from server”.

System action

TCPIP continues.

Operator response

Resubmit the NSLOOKUP command with a valid value for the RETRY option of the SET subcommand. For more information about the NSLOOKUP command and its subcommands and options, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

Assist the user as necessary.

Module

NSLOOKUP

Procedure name

SetOption

Explanation

The TIMEOUT option to the SET subcommand of the NSLOOKUP command was submitted with an incorrect value. The NSLOOKUP command is not accepted. The TIMEOUT option specifies the number of seconds to wait before canceling a request. If the TIMEOUT option is set to 0, requests are canceled immediately and are never answered.

System action

TCPIP continues.

Operator response

Resubmit the NSLOOKUP command with a valid value for the RETRY option of the SET subcommand. For more information about the NSLOOKUP command and its subcommands and options, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

Assist the user as necessary.

Module

NSLOOKUP

Procedure name

SetOption

Explanation

The SET subcommand was submitted with an option that the Domain Name Server did not recognize. The command is not accepted.

System action

TCPIP continues.

Operator response

Check the spelling and syntax and resubmit the command. For more information about valid options for the SET subcommand, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

Assist the user as necessary.

Module

NSLOOKUP

Procedure name

SetOption

EZB3020I	Set options:
EZB3021I	<i>nodebug nodefname nosearch norecurse</i>

EZB3034I	<i>domain=domain</i>
EZB3035I	<i>nobrackets</i>
EZB3194I	<i>diff/time/nostamp</i>
EZB3036I	<i>srchlist=domain1/domain2/domain3</i>

Explanation

These messages display the state information used by the resolver library and other options set by the user. The prefix *no* to an option name indicates that the option is not selected. For more information about these options, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System action

TCPIP continues.

Operator response

None.

System programmer response

None.

Module

NSLOOKUP

Procedure name

ShowOptions

EZB3038E	*** Can't initialize resolver.
-----------------	---------------------------------------

Explanation

The Domain Name Server was unable to initialize the resolver library routines, which are used by clients to request resolution by the Domain Name Server. This indicates that there was an error in specifying the configuration file for the resolver, the RESOLVER address space was not started, or the Domain Name Server was unable to allocate the configuration data set. See [z/OS Communications Server: IP Configuration Reference](#) for an explanation of the search order for the configuration data set.

System action

Initialization halts. TCPIP continues.

Operator response

Check the syntax of the configuration data set, start the RESOVLER address space, and resubmit the command. If the error persists, specify the configuration options using the NSLOOKUP command and its

parameters. For more information about the configuration data set, see [z/OS Communications Server: IP Configuration Reference](#). For more information about the NSLOOKUP command and its parameters, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

Make more storage available to the Domain Name Server if necessary.

Module

NSLOOKUP

Procedure name

Main

EZB3039E *** Can't find server address for 'server':

Explanation

While initializing the resolver library used by the clients to request domain name resolution, the Domain Name Server was unable to find an IP address for the indicated server.

System action

Initialization halts. TCPIP continues.

Operator response

Correct the configuration data set to include an IP address for the default Domain Name Server. For more information about the domain name server configuration data set, see [z/OS Communications Server: IP Configuration Reference](#).

System programmer response

Assist the user as necessary.

Module

NSLOOKUP

Procedure name

ReadRC

EZB3040E *** Can't find server name for address *address*: *reason*

Explanation

While initializing the resolver library, which is used by the client to request domain name resolution, the Domain Name Server was unable to find a server name for the indicated address.

System action

Initialization halts. TCPIP continues.

Operator response

Correct the TCPIP.DATA data set to include a NSINTERADDR statement for the IP address of the Domain Name Server, or enter the NSLOOKUP command, using the *server_name* and *server_address* parameters to specify the default Domain Name Server. For more information about the Domain Name Server configuration and the steps involved, see [z/OS Communications Server: IP Configuration Reference](#). For more information about the NSLOOKUP command and its parameters, see the [z/OS Communications Server: IP User's Guide and Commands](#).

System programmer response

Assist the user as necessary.

Module

NSLOOKUP

Procedure name

Usage

EZB3041E	*** Default servers are not available
-----------------	--

Explanation

The Domain Name Servers specified as the default servers in the resolver library used by the client to request address resolution by the Domain Name Server are not available.

System action

Initialization halts. TCPIP continues.

Operator response

Use the NSLOOKUP command with the *server_name* and *server_address* parameters to specify a different default server. If the error persists, notify the system programmer.

System programmer response

Make sure that the indicated Domain Name Servers are started and online.

Module

NSLOOKUP

Procedure name

Usage

EZB3042I	> command
-----------------	---------------------

Explanation

This message is the command prompt for interactive NSLOOKUP sessions. For more information about interactive sessions using NSLOOKUP, see the [z/OS Communications Server: IP User's Guide and Commands](#).

-----------------	--

Explanation

The Domain Name Server received a query of a type it does not recognize. The query cannot be processed, and too many queries of this type will tie up the name server, preventing it from replying to valid queries. The query is not processed.

System action

TCPIP continues.

Operator response

Notify the system programmer of the problem.

System programmer response

Check the indicated client to determine why it is sending queries of an incorrect type. Take the client offline until the problem is corrected.

EZB3206I nslookup [-option ...] [host-to-find | - [server]]

EZB3207I Commands: (identifiers are shown in uppercase, <> means optional)

EZB3208I NAME - print info about the host/domain NAME using

EZB3209I default server

EZB3210I NAME1 NAME2 - as above, but use NAME2 as server

EZB3211I help or ? - print info on common commands;

EZB3212I use TSO's help nslookup for more details

EZB3213I set OPTION - set an option

EZB3214I all - print options, current server and host

EZB3215I <no>debug - print debugging information

EZB3216I <no>d2 - print exhaustive debugging information

EZB3217I <no>defname - append domain name to each query

EZB3218I <no>recurse - ask for recursive answer to each query

EZB3219I <no>vc - always use a virtual circuit

EZB3220I domain=NAME - set default domain name to NAME

EZB3221I srchlist=N1</N2/.../N6> - set domain to N1 and search

EZB3222I list to N1,N2, etc.

EZB3223I root=NAME - set root server to NAME

EZB3224I retry=X - set number of retries to X

EZB3225I	timeout=X - set initial time-out interval to X seconds
EZB3226I	querytype=X - set query type, e.g.,
EZB3227I	A,ANY,CNAME,HINFO,MC,NS,PTR,SOA,WKS
EZB3228I	type=X - synonym for querytype
EZB3229I	class=X - set query class to one of IN (Internet),
EZB3230I	CHAOS, HESIOD or ANY
EZB3231I	server NAME - set default server to NAME, using current
EZB3232I	default server
EZB3233I	lserver NAME - set default server to NAME, using initial server
EZB3234I	finger <USER> - finger the optional NAME at the current
EZB3235I	default host
EZB3236I	root - set current default server to the root
EZB3237I	ls <opt> DOMAIN [> DATASET] - list addresses in DOMAIN
EZB3238I	(optional: output to DATASET)
EZB3239I	-a - list canonical names and aliases
EZB3240I	-h - list HINFO (CPU type and operating system)
EZB3241I	-s - list well-known services
EZB3242I	-d - list all records
EZB3243I	-t TYPE - list records of the given type
EZB3244I	(e.g., A, CNAME, MX, etc.)
EZB3245I	view DATASET - sort an 'ls' output file and view it with more
EZB3246I	exit - exit the program

Explanation

This is the summary of available commands and options that you can review by typing help or ? at the > prompt (see message EZB3042I), once you have entered the NSLOOKUP interactive session. For details about any of these commands or options, see [z/OS Communications Server: IP User's Guide and Commands](#).

System action

The name server continues until you type exit at the > prompt (see message EZB3042I).

Operator response

Use these help messages as a guide for entering subsequent NSLOOKUP commands.

System programmer response

None.

DIG

Procedure name

PrintHelp()

EZB3434I**Can not read DIG environmental data set. Defaults used.**

Explanation

This message is displayed if a DIG command was invoked with the -envsav option from an unsupported release of Communications Server. This option is not compatible with the current supported releases of Communications Server.

System action

No query options saved from the DIG command prior to Communications Server for V1R2 are restored to a Communications Server for V1R2 or later release of the DIG command.

Operator response

To create an environmental data set in a Communications Server for V1R2 or later format, use the -envsav option with any DIG command that has the query options required. See [z/OS Communications Server: IP User's Guide and Commands](#) for information about the TSO DIG command.

EZB3566I *RDATA Error: resource record***Explanation**

The resource record displayed is missing the RDATA field.

System action

NLDBLOAD increments an error counter and continues.

Operator response

Correct the resource record of the name server SQL table.

System programmer response

None.

Module

NSDBLOAD

Procedure name

EZB3825T

name/udp: unknown service

Explanation

A UDP port number for the service *name* was not assigned in the tcpip.v3r1.ETC.SERVICES data set.

System action

NCPROUTE exits.

Operator response

None.

System programmer response

Verify that the tcpip.v3r1.ETC.SERVICES data set has two entries in the form:

ncproute

port/udp

router

port/udp

The entries must start in column 1 and be in lowercase. Verify that the NCPROUTE service port number is the port being used by the NCP clients. The port value defined in the UDPPORT= keyword on the IPOWNER statement in the NCP generation definition must match the NCPROUTE service port. The default is UDP port 580.

The reserved router service port number is 520 and is required for the NCPROUTE transport of RIP packets to NCP clients, which are responsible for broadcasting the packets to other RIP routers. The router service port number cannot be overridden as a result of an NCP restriction.

Also, verify that port 580 has been reserved for NCPROUTE under the PORT statement in the tcpip.v3r1.PROFILE.TCPIP data set.

Module

NRMAIN

Procedure name

main

EZB3826I

Port port assigned to name

Explanation

NCPROUTE will listen for traffic from NCP clients on the specified port *port* assigned to service *name*.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

If communications cannot be established with a client, compare NCPROUTE's port number with the value specified in the client's NCP generation definition. The port value defined in the UDPPORT= keyword on the IPOWNER statement in the NCP generation definition must match.

Module

NRMAIN

Procedure name

main

EZB3827T**Terminating since clients require the socket**

Explanation

NCPROUTE attempted to open a socket on a well known or user-defined port but the open was not successful, or the socket could not be bound to an IP address and port number. Clients will not be able to communicate with NCPROUTE because a socket is not available.

System action

NCPROUTE ends abnormally.

Operator response

None.

System programmer response

Examine previous messages to determine the nature of the error as indicated by a detailed tcperror() library message. Correct the problem as indicated by error. See the [z/OS C/C++ Runtime Library Reference](#) for more information about socket() function errors.

Module

NRMAIN

Procedure name

Main

EZB3828T**Usage: NCPROUTE *parameters***

Explanation

Incorrect parameters were passed to NCPROUTE.

System action

NCPROUTE ends abnormally.

Operator response

None.

System programmer response

Verify that the parameters are correct. The parameters are case-sensitive and must be separated by spaces. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

NRMAIN

Procedure name

main

EZB3829I	Waiting for incoming packets
-----------------	-------------------------------------

Explanation

NCPROUTE is waiting for datagrams from NCP clients. Each time at which NCPROUTE finishes processing an event, such as an incoming datagram or a timer that expires, NCPROUTE issues this message and waits for the next event. These messages should occur at least once every 30 seconds, but will increase in frequency as the server performs more work.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Check to see if the assigned port number for NCPROUTE matches the NCP clients' generation definitions.

If six or more of these messages occur consecutively, NCPROUTE is not receiving any datagrams from NCP clients. Verify that a client has an established session with NCPROUTE, and if one exists, examine the status of the client's interfaces.

Module

NRMAIN

Procedure name

main

EZB3830E	The main select was interrupted:
-----------------	---

Explanation

An error occurred while NCPROUTE was waiting for an event to occur. A more detailed tcperror() library message follows.

System action

NCPROUTE continues, unless an IUCV error occurred.

Operator response

None.

System programmer response

Verify that TCPIP is running.

Module

NRMAIN

Procedure name

Main

EZB3831I	Send delayed dynamic update
-----------------	------------------------------------

Explanation

A routing update, which had been delayed to prevent packet storms, has been transmitted. This occurs 2–5 seconds after a dynamic update has been issued.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRMAIN

Procedure name

Main

EZB3832E	While receiving a packet from a client:
-----------------	--

Explanation

An error occurred while attempting to receive a packet from a client. A more detailed tcperror() library message follows.

System action

NCPROUTE continues, and the incoming packet is discarded. If an IUCV error occurs, NCPROUTE will end.

Operator response

None.

System programmer response

See the next generated error message and correct the error.

Module

NRMAIN

Procedure name

process

EZB3833E**While receiving a packet from the SNMP agent: agent**

Explanation

An error occurred while attempting to read a packet from the SNMP agent. A more detailed tcperror() library message follows. If the connection with the Agent has been reset, the SNMP agent will be terminated and incoming SNMP requests will be ignored.

System action

NCPRROUTE continues. The SNMP packet is discarded. If an IUCV error occurs, NCPRROUTE will end.

Operator response

None.

System programmer response

If the connection with the SNMP agent has been reset, restart the SNMP daemon (OSNMPPD).

Module

NRMAIN

Procedure name

read_dpi

EZB3834I*********

Explanation

Two of these banners enclose a message that may need attention. when viewing the output. The severity of the enclosed message is indicated.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Read the enclosed message and, if necessary, resolve the indicated situation.

Module

various.

Procedure name

various.

EZB3835T**Invalid parameter: *parameter*****Explanation**

An incorrect parameter was passed from the tcpip.v3r1.SEZAINST(NCPROUT) start proc JCL. The parameter could be passed from the command line parameters or from the default parameter list in the start proc JCL.

System action

NCPROUTE exits.

Operator response

None.

System programmer response

Correct the parameter from the command line parameters or in the default parameter list of the start proc JCL.

Module

NRMAIN

Procedure name

main

EZB3836W**The SNMP agent has terminated****Explanation**

The socket used to communicate with the SNMP agent has been reset. This implies that the SNMP agent has ended. Without this socket, SNMP requests are not processed.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

If the SNMP agent (OSNMPD) is not running, restart the agent. NCPROUTE will attempt to reestablish communications with the agent after each new SNMP request is received, so no further action is required. If the agent is running, contact IBM software support services.

Module

NRMAIN

Procedure name

read_dpi

EZB3837W**SNMP requests will be ignored until it is restarted.****Explanation**

Because communication with the SNMP agent is not possible, incoming SNMP requests are ignored until a connection has been established.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Start the SNMP agent (OSNMPD). NCPROUTE will attempt to establish communication with the agent for each SNMP packet received until a connection is established.

Module

NRMAIN

Procedure name

read_dpi

EZB3838W**An SNMP DPI packet arrived from a non-internet machine****Explanation**

An SNMP DPI packet was received from a non-Internet network. SNMP DPI traffic is only accepted from machines running TCPIP. The incoming packet is discarded.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Locate the machine generating the SNMP DPI packet and have it stopped. Ignore these messages.

Module

NRMAIN

Procedure name

read_dpi

EZB3839T**A socket could not be created:**

Explanation

NCPROUTE could not open a new socket. With the socket unavailable, the NCP clients will not be able to establish communications with NCPROUTE. A more detailed `tcperror()` library message follows.

System action

NCPROUTE ends abnormally.

Operator response

None.

System programmer response

Verify that TCP/IP is active, that another program is not using NCPROUTE's port, that the well-known port has been reserved in the `PORT` statement of `hlq.PROFILE.TCPIP` data set, and that the user-defined port has been specified in `hlq.ETC.SERVICES` data set. Correct the problem as indicated by the error in the detailed `tcperror()` library message. See the [z/OS C/C++ Runtime Library Reference](#) for more information about `socket()` function errors.

Module

NRMAIN

Procedure name

getsocket

EZB3840T**Broadcasting cannot be enabled on the socket:**

Explanation

NCPROUTE cannot enable the socket for broadcasting. NCPROUTE must be able to broadcast over interfaces which support broadcasting in order to communicate with the NCP clients. A more detailed `tcperror()` library message follows.

System action

NCPROUTE ends abnormally.

Operator response

None.

System programmer response

Contact IBM software support services.

Module

NRMAIN

Procedure name

getsocket

EZB3841T**The socket bind failed**

Explanation

NCPRROUTE was unable to associate an IP address and port number to the newly created socket. Another application could be using the port. A more detailed tcperror() library message follows.

System action

NCPRROUTE ends abnormally.

Operator response

None.

System programmer response

Use the NETSTAT ALLCONN command to verify that there is no other application using the NCPRROUTE port number. Look for a port in the "Local Socket" column which matches NCPRROUTE's port in the *hlq.ETC.SERVICES* data set. You should reserve this port for NCPRROUTE's exclusive use by adding an entry to the PORT statement in the *hlq.PROFILE.TCPIP* data set.

Module

NRMAIN

Procedure name

Getsocket

EZB3842W

Hello from existing client *client*

Explanation

An NCP client with a current session has entered a reset state and has started to send Hello packets in an attempt to establish a session with NCPRROUTE. This client might have been shut down and restarted. The current session ends and a new one is started.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Module

NRPDUS

Procedure name

Pdu_in

EZB3843W

Status from a session-less client *client*

Explanation

A client has transmitted an interface status change PDU without first establishing a session with NCPROUTE. This is a protocol violation. The PDU is discarded. Also, the client is added to a “Client Protocol Violation List” and no further error messages will be issued for this client until it successfully establishes a session. At that point, NCPROUTE will accept the client, and the client's name will be removed from the list.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Restart the client NCP. If the problem persists, contact IBM software support services.

Module

NRPDUS

Procedure name

pdu_in

EZB3844W

This datagram is being ignored

Explanation

A datagram was received and some outstanding error prevents NCPROUTE from operating on the packet. The most likely cause is that a protocol error occurred between the client and NCPROUTE. The datagram is discarded.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Identify the cause of the error from a previous error message and correct the problem. The client must be reset so that a new session is established.

Module

NRPDUS

Procedure name

EZB3845W

Transport from session-less client *client*

Explanation

A client NCP has transmitted a Transport PDU without first establishing a session with NCPRROUTE. This is a protocol violation. The PDU is discarded. Also, the client is added to a “Client Protocol Violation List” and no further error messages will be issued for this client until it successfully establishes a session. At that point, NCPRROUTE will accept the client and the client's name will be removed from the list.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Restart the client NCP. If the problem persists, contact IBM software support services.

Module

NRPDUS

Procedure name

pdu_in

EZB3846W**InactList from session-less client *client***

Explanation

A client NCP has transmitted an inactive interface PDU without first establishing a session with NCPRROUTE. This is a protocol violation. The PDU is discarded. Also, the client is added to a “Client Protocol Violation List” and no further error messages will be issued for this client until it successfully establishes a session. At that point, NCPRROUTE will accept the client and the client's name will be removed from the list.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Restart the client NCP. If the problem persists, contact IBM software support services.

Module

NRPDUS

Procedure name

pdu_in

EZB3847W**Protocol Violation: client *client* sent**

Explanation

A foreign machine sent a packet to the NCPROUTE port that does not contain a valid type field in the packet header. This is probably not an NCP, but another machine on the network. The PDU is discarded. Also, the client is added to a “Client Protocol Violation List” and no further error messages will be issued for this client until it successfully establishes a session. At that point, NCPROUTE will accept the client and the client's name will be removed from the list.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Identify the source of the packet from the displayed IP address and correct the problem. If the machine in question is an NCP, verify that it is loaded with the correct software and reset it. If the machine is an NCP and resetting it does not correct the problem, contact IBM software support services.

Module

NRPDUS

Procedure name

pdu_in

EZB3848W	An excessive number of clients (#) have been issued protocol violations. Further warning messages will be suppressed.
-----------------	--

Explanation

A large number of clients have committed protocol violations and have not subsequently established sessions with NCPROUTE. No further “Warning” messages are issued. NCPROUTE assumes that the problems have been noticed by this point and that steps are being taken to correct them.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Verify that the most recent versions of NCPROUTE and the NCP drivers are installed. Verify that previous protocol errors on individual client NCPs were investigated and corrective actions were taken. Contact IBM software support services if the protocol violations continue.

Module

NRPDUS

Procedure name

bad_client

EZB3850E

Status change for unknown interface *interface*

Explanation

NCPRROUTE received a status change request PDU from the NCP client for an interface that was unknown. Either NCPRROUTE did not completely read in the NCP client's Routing Information Table (RIT), or the RIT was not built correctly during NCP generation. Another possible cause is that the NCP client dynamically added the interface to its tables. Dynamically-added interfaces are not currently supported by NCPRROUTE. The Status PDU is discarded.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Check the interface configuration messages created in the console log at install time to verify that the interfaces defined in the NCP client's generation match the interfaces processed by NCPRROUTE. If a mismatch is found, verify that the RIT is built correctly. If the problem cannot be corrected, contact IBM software support services.

EZB3855I

NCP_Add out to *client* Route to *address1* via interface *interface* to *address2* Metric: *metric*, Type *type*, Subnetmask *mask*

Explanation

An "Add" PDU is being sent to a client, which causes a route to be added to its IP route tables.

address1 is the destination IP address of the route.

The *interface* is the name given to the interface during NCP generation.

address2 is the IP address of an intermediate router or zero if the destination is directly connected.

The *metric* is the relative cost of using this route as opposed to another route.

The *type* is either Host, Subnet, or Network and indicates the route type being added.

System action

NCPRROUTE continues.

Contact IBM software support services.

Module

NRPDUS

Procedure name

recv_hello

EZB3875W**Variable subnetting not supported by client *client***

Explanation

Variable subnetting is not supported by the *client* and the RIP supply/receive control setting may have been set in the NCPROUTE configuration such that RIP Version 2 packets are to be sent or received over interface(s). NCPROUTE will override the control settings to RIP1 for compatibility with the NCP client configuration.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Verify the NCP software level for variable subnetting support in the NCP client. If RIP Version 2 packets are not to be used, correct the NCPROUTE profile data set or the NCP client's gateways data set to use RIP Version 1 packets.

Module

various

Procedure name

various

EZB3876I**Hello from new client *client***

Explanation

An NCP client is attempting to establish a session with NCPROUTE. This is done by sending a "Hello" PDU containing the NCP name and correlation string used to verify that the correct Routing Information Table (RIT) is loaded.

Note: The NCP client will issue many "Hello" PDUs up to the maximum specified in the NCP gen until it successfully establishes a session with the server. Once the maximum is reached, the NCP client will repeat the cycle again after a 9-minute delay timer has expired. The delay timer is used to prevent NCP alert flooding. The NCP client's issuance of "Hello" PDUs can happen even after the server has established a session with the NCP client. For example, the NCP client could have been restarted. An attempt will be made to establish a new session.

EZB3880E	Error opening RIT <i>client1</i> for client <i>client2</i>
----------	--

Explanation

The Routing Information Table (RIT), which was created during NCP generation, could not be opened. *client1* is the name of the member on which the load was attempted, *client2* is the IP address of the client that is attempting to establish a session with NCPROUTE. NCPROUTE does not establish the session.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Examine the abend code and reason code in the following EZB3881E message for the specific cause of the error. In the event of an 804 abend, verify that the RIT exists and is accessible to NCPROUTE.

Module

NRPDUS

Procedure name

```
recv_hello
```

EZB3881E **Abend code:** *abend*, **Reason:** *reason*

Explanation

An abend occurred during an attempt to load the Routing Information Table (RIT) into memory with the LOAD macro. The abend and reason code returned are displayed. The session with the server is not established.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

See [z/OS MVS System Codes](#) for an explanation of the abend and reason codes, and further instructions.

Module

NRPDUS

Procedure name

recv_hello

EZB3882E**A session will not be established**

Explanation

An error occurred during an attempt to establish a session with a client, and the session cannot be established at this time.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Correct the errors described in previous messages.

Module

NRPDUS

Procedure name

recv_hello

EZB3883E**Client: *client***

Explanation

An error occurred during a transaction with the client. The client is the IP address of the client. This message is used to identify the failing client, and is followed by additional messages.

System action

NCPROUTE issues additional messages.

Operator response

None.

System programmer response

Examine the messages that follow for a description of the error.

Module

NRPDUS

Procedure name

recv_hello

EZB3884E	The RIT ID field does not match the one in the Hello. RIT <i>idfield</i>, Hello: <i>correlfield</i>
-----------------	--

Explanation

The ID field in the Routing Information Table (RIT) does not match the correlation field passed from the client NCP in the hello datagram. The mismatched ID and correlation fields are displayed. This indicates that the client is using a generation that is different from the one that built the RIT. A session is not established.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Generally, the RIT used by NCPROUTE should be the RIT that was generated during the generation of the current NCP load. In this case, an older RIT with the same name is probably being loaded. Locate and remove the old RIT. In some cases, multiple machines might want to own a single NCP and use the same NCP generation, but would require a unique RIT to run correctly. See the NCP documentation for instructions about how to set the correlation string in your generations and during NCP load.

Module

NRPDUS

Procedure name

recv_hello

EZB3885I	Input parameters: <i>parms</i>
-----------------	---------------------------------------

Explanation

This message lists the string of input parameters passed to NCPROUTE from tcpip.v3r1.SEZAINST(NCPROUTE) start proc JCL. The parameters could either be passed from the command line parameters or from the defined parameter list in the start proc JCL. If no parameters are specified, '*None.*' will appear in the string.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Locate the machine generating the RIP packet and have it stopped. These messages can also be ignored.

Module

NRINPUT

Procedure name

rip_input

EZB3928E**RIP version 0 packet received from *ipaddr***

Explanation

A Routing Information Protocol (RIP) Version 0 packet was received from the specified address. This RIP version is obsolete. The incoming packet is discarded.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Correct the router that is sending the Version 0 packets.

Module

NRINPUT

Procedure name

rip_input

EZB3929I**Request: output routines removed**

Explanation

NCPROUTE received a Routing Information Protocol (RIP) request packet for a specific set of routes rather than for a set of all routes. (A request for all routes is indicated by an address family of 0 and infinite metric of 16.)

Since NCPROUTE does not support handling requests for a specific set of routes, the output routines in this case have been removed to prevent a response.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRINPUT

Procedure name

rip_input

EZB3930W

Trace command from unknown router *ipaddr*

Explanation

A trace packet was received from a router that is either not directly connected to any of the client's Routing Information Protocol (RIP) managed interfaces, or is directly connected to an interface that is not capable of supporting RIP traffic. RIP requires that an interface be capable of supporting link-level broadcast traffic, be a point-to-point interface (such as NCST sessions), or have an active gateway defined. The incoming packet is discarded.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Determine where the packet originated from and correct the problem. Bridges can allow routers on logically disconnected networks to talk with each other even though the routers have no logical connection to each other's networks.

Module

NRINPUT

Procedure name

rip_input

EZB3931W

Response from non-router *ipaddr*

Explanation

A Routing Information Protocol (RIP) response packet was received with an incorrect port number. All routers on a network must agree on the port number that is used to exchange routing information, and this port must be restricted so that other applications cannot generate routing updates. Either a router is configured using the wrong port number, or an application issues RIP routing updates. The RIP response is discarded.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Reconfigure the router to use a correct port number or locate the application that is generating the updates and correct the problem.

Module

NRINPUT

Procedure name

rip_input

EZB3932W Invalid packet from passive interface *interface*

Explanation

A Routing Information Protocol (RIP) response packet was received from a passive interface. Passive interfaces receive routing updates from the client, but cannot produce routing updates. The packet is discarded.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Locate the router that is producing the bogus packet and correct the problem.

Module

NRINPUT

Procedure name

rip_input

EZB3933W Packet from unknown router *ipaddress (reason)*

Explanation

A Routing Information Protocol (RIP) response was received from a router which is not directly connected via a broadcast network, a point-to-point (NCST) network, or an active gateway as defined in a GATEWAYS PDS member. The description of the reason for this warning is one of the following:

Reason

Explanation

Interface in strange state

The network does not support broadcast or point-to-point transmission.

Iflookup failed

Not directly connected.

Link is PASSIVE!

Cannot update.

The packet is discarded.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Locate the router that produced the packet and correct the problem.

EZB3959I

point-to-point interface, using *addrtype*

Explanation

The new interface is point-to-point, and the destination address type, *addrtype*, can either be *dstaddr* or *broadaddr*. The address type is determined by the interface definition in the NCP generation. The destination address may be coded such that the network or subnetwork directed broadcast address is used or that the unicast or host address representing the other end of the point-to-point link is used. This address is used for sending routing information over an interface to the destination router or host. The exception is when the interface is multicast-capable; the multicast address is used.

Operator response

None.

System programmer response

Examine previous error messages to determine the nature of nr_do_add's error.

Module

NRTABLES

Procedure name

nradd

EZB3989I	<i>changing/deleting route to interface <i>interface</i> (timed out?)</i>
-----------------	--

Explanation

Either traffic to a local interface is being routed through a remote gateway, or the metric on the interface has increased to infinity. Usually this indicates that the interface has timed out and is considered down.

System action

NCROUTE continues.

Operator response

None.

System programmer response

If the interface is being assigned a new gateway, examine the contents of the last packet sent from the gateway. The gateway's address is found in an upcoming message. Look for a display of the local interface from the remote gateway. Correct the remote gateway if needed. If the interface is timing out, verify that no transmissions have been received over this interface for the last 3 minutes. If no transmissions are found, this is correct behavior for NCROUTE, and the physical lines or remote gateways should be examined to determine the cause of the problem.

Module

NRTABLES

Procedure name

nrchange

EZB3993E	<i>could not delete route to <i>type destination</i> via <i>router</i></i>
-----------------	---

Explanation

The route to *destination* is being deleted (possibly because the route is changing, in which case an add will follow) and nr_do_delete returned an error. *type* is one of Host, Network, Subnet, or (bad_type). (bad_type) indicates an internal error and should be reported. Additional errors might follow because of the unsuccessful attempt to remove the route. These should be ignored until this problem is resolved. The route remains.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Examine previous messages to determine the error that occurred in `nr_do_delete`, contact IBM software support services with this information.

Module

Procedure name

dsp_rtbl

EZB4009I client *client*: *timer_value* minute timer expired for route to *destination*

Explanation

No Routing Information Protocol (RIP) packets have been received from the NCP client to the destination *destination* in the last *timer_value* minutes. It is assumed that the destination route is no longer active. Depending upon the *timer_value*, one of the following actions is taken:

Value

Action

3

The route will have its metric changed to infinity for the next 2 minutes. The metric change is necessary to alert adjacent routers that the route to this destination is unreachable. If NCPRROUTE receives any RIP packets for the NCP client from the destination router during the 2 minute time interval, NCPRROUTE will restore the route by changing the metric to a valid one based upon the received RIP packet. The route will be deleted from the NCP client's routing table.

5

The route will be deleted from NCPRROUTE's routing table for the NCP client.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

These actions require the following responses:

Value

Action

3

If the route was broadcasted for a while, and then suddenly stopped, look for an adapter problem, or a problem with the physical line.

5

Examine the NCPRROUTE trace output and determine when the broadcasting has stopped for the route to the destination router. If the route to *destination* was only broadcast once in response to the NCPRROUTE's request for full route tables for the NCP client, then the problem may be with the way RIP packets are broadcasted.

In these cases, determine if NCPRROUTE is receiving the transport PDUs containing the RIP packets from the NCP client by obtaining a MORETRACE IPUP trace and look for "discarding broadcast" packet messages. This trace can confirm the lack of traffic on the interface used for the transport PDUs forwarded by the NCP client. If this is not the case, then determine if NCPRROUTE is receiving the RIP packets over the NCP client's routing interface by obtaining a NCP line trace. See the NCP documentation for instructions on obtaining a line trace.

Module

NRTIMER

Procedure name

client_timer

EZB4010I

client *client*: 30 second timer expired (broadcast)

Explanation

Every 30 seconds, a timer expires that indicates that a client NCP must broadcast its routing tables to adjacent routers. NCPROUTE will build Routing Information Protocol (RIP) response packets for each of the client's interfaces and send them to the client in a transport PDU. The client transmits them on the specified interface.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRTIMER

Procedure name

client_timer

EZB4011E

Invalid subnetwork mask *mask*

Explanation

In the line entry for the NCP client's gateways data set, the gateway definition has a subnetmask that is not valid. The subnetmask must be a resolvable subnetmask name, or a bit mask in dotted-decimal notation. The gateway entry is ignored.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Correct the NCP client's gateways data set.

Module

NRSTART

EZB4045I

RIPcmd direction router -> port timestamp p

Explanation

A Routing Information Protocol (RIP) datagram has been received, or is about to be sent out of NCPRROUTE depending on the direction value. A value of “to” indicates an outbound datagram, while a value of “from” indicates an inbound datagram. The type of the datagram is indicated by *RIPcmd*, and can be either RESPONSE or REQUEST. Responses are displays of routes from one router to another, requests are requests for individual routes or full tables. The value of *port* is either the port number which the packet came in on, the value 0, which indicates that the datagram will be sent to the default *RouteD* port as described in ETC.SERVICES, or in the case of outbound datagrams with a nonzero value the port which the datagram will be sent to.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRTRACE

Procedure name

dumppacket

EZB4046S

***Bad cmd hex direction router -> port timestamp size=size cp=direction
packet=addr time=timestamp***

Explanation

A malformed packet has been encountered during trace. The source of the packet is either the router, if the value of *direction* is “from”, or NCPRROUTE if the value of *direction* is “to”.

System action

NCPRROUTE continues

Operator response

None.

System programmer response

If the source of the packet is NCPRROUTE, contact IBM software support services. Otherwise locate the router and take corrective action.

Module

NRTRACE

Procedure name

dumppacket Routing Information Protocol (RIP)

EZB4048E (truncated record, len *len*)

Explanation

A Routing Information Protocol (RIP) datagram was received that did not end on a route boundary. Either the packet was too large, or it has been truncated.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Verify that the packet received was built correctly and can be processed with other routers. Contact IBM software support services if the problem appears to be with NCPRROUTE.

Module

NRTRACE

Procedure name

dumppacket

EZB4049I destination *destination* metric *metric*

Explanation

A route to the destination at the indicated metric is being displayed from NCPRROUTE or an adjacent router depending on the contents of the last EZB4045I message. The metrics displayed to NCPRROUTE by other routers do not have the interface metrics added to them, this is done when the route is added to NCPRROUTE's tables. Likewise, NCPRROUTE displays routes at a metric which does not include the metric of the interface on which the route is being displayed. A route is never displayed on the interface from which it was received.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRTRACE

Procedure name

dumppacket

EZB4050I (request for full tables)

Explanation

A request for a complete routing table is being sent, or has been received depending on the contents of the last EZB4045I message. This message is sent during session initialization by NCPRROUTE. In addition to foreign routers making this request, application programs can ask a client for its tables by sending a Routing Information Protocol (RIP) request for a route with an address family of 0 and a metric of 16 to a client NCP at the current *RouteD* port (by default, 520).

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRTRACE

Procedure name

dumppacket

EZB4051E unknown address family *family* metric *metric*

Explanation

A route in an unacceptable address family has been received, or is about to be sent depending on the contents of the last EZB4045I message. Currently, only AF_INET is supported, although AF_UNSPEC is allowed when making requests for full tables.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

If the route is being sent from NCPROUTE, contact IBM software support services. Otherwise locate the router listed in the last EZB4045I message and correct it so that noninternet routes are not sent to the client NCP.

dpi_in

EZB4076I **RIP2 packet from router *router* not authorized**

Explanation

A RIP Version 2 packet, received from *router*, is ignored as a result of a authentication key mismatch. Authentication is enabled for RIP Version 2 packets according to the interface options in the NCP client's gateways data set or in the NCPRROUTE profile data set. If there are no interface settings, NCPRROUTE will use the one from the profile settings.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRINPUT

Procedure name

rip_input

EZB4077S **SNMP sub-agent: received DPI request outside tree**

Explanation

The SNMP agent has requested information or action on a MIB variable that is outside of the tree that NCPRROUTE manages. This indicates an error in the agent code, because NCPRROUTE did not register this variable. NO_SUCH_NAME is returned.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Compare the object identifier for the current DPI packet with the region of the MIB tree that NCPRROUTE manages. The object identifier can be found in the last EZB4072I, EZB4073I, or EZB4074I message issued. The registered region can be found in the last EZB4064I message issued.

Module

NRSNMP

Procedure name

dpi_in

EZB4078I **SNMP sub-agent: received invalid DPI request outside tree**

Explanation

The DPI packet from the agent refers to an OID which is not present in the managed tree.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

dpi_in

EZB4079I **iproutedest.instance**

Explanation

A request has been made for the destination of the specified route. Each route in the client’s table is numbered starting with 0.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4080I	iprouteifindex.destination
-----------------	-----------------------------------

Explanation

A request has been made for the interface index associated with the route to *destination* for the client which forwarded this request to NCPRROUTE.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4081I	iproutemetric1. destination
-----------------	------------------------------------

Explanation

A request has been made for the metric associated with the route to the destination for the client that forwarded this request to NCPRROUTE.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4082I *iproutemetric(2-4).destination (unsupported)*

Explanation

A request was made for one of the alternate route metrics that is not used under RIP. If a route to the specified destination exists, a value of '-1' is returned; otherwise, NO_SUCH_NAME will be returned.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4083I *iproutenexthop.instance*

Explanation

A request was made for the next hop for the specified route. Routes are specified by the instance number, which is the ordinal position in NCPROUTE's tables. If the specified instance exists, an IP address will be returned; otherwise, NO_SUCH_NAME will be returned.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4084I	<i>iproutetype.instance</i>
-----------------	-----------------------------

Explanation

A request was made for the route type for the specified route. If the specified instance exists, one of three values will be returned depending on the route state:

Value
Explanation

Direct
The route is to a directly connected destination.

Invalid
The route has an infinite metric.

Remote
The route is to an indirectly connected destination requiring one or more routers to reach.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4085I	<i>iprouteproto.instance</i>
-----------------	------------------------------

Explanation

A request was made for the mechanism by which the route for the specified instance was determined. Values returned will be 'RIP' or 'Other' depending on whether the route was learned dynamically or was manually entered.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4086I *iprouteage.instance*

Explanation

A request was made for the age of the route of the specified instance. The value returned will be the length of time the route has been active.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4087I *iproutemask.instance*

Explanation

A request was made for the network or subnetwork mask of route of the specified instance. The value returned will be the network or subnetwork mask value in dotted-decimal notation.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4088E	A request was made for an unsupported MIB variable: <i>variable</i>
-----------------	--

Explanation

A request was made for an unsupported MIB variable. Only variables in the iproute group are returned. NO_SUCH_NAME will be returned for the unsupported MIB variable.

System action

NCPROUTE continues.

Operator response

Reissue the request with a valid MIB variable from the iproute group.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4089E	An attempt was made to change a MIB variable. SNMP set request is not currently supported.
-----------------	---

Explanation

An attempt was made to change a MIB variable. Variables in the iproute group may be queried but not changed. An SNMP_GEN_ERR is returned.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

dpi_set

EZB4090E **SNMP buffer overrun: *number* bytes**

Explanation

An SNMP request will exceed NCPRROUTE's internal buffer size during an edit. This almost always indicates an incorrect request because no supported object identifier is large enough to cause this. The buffer is discarded.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Verify the object identifier being requested is for an iproute MIB variable. If it is, contact IBM software support services.

Module

NRSNMP

Procedure name

edit_obj

EZB4125I **ASN.1 type at *count* bytes into packet: *Class=class* *Field=field***

Explanation

An ASN.1 object such as an object identifier or an integer was located in the SNMP packet being displayed. The count is the offset into the packet where the object was located. The object's tag's class bits are formatted and displayed as *class*. An object's class can be viewed as the scope of the object identifier. ASN.1 defines four values:

Value

Explanation

Universal

Well-known tags. NCPRROUTE wants this type of tags.

Application-Wide

Tags local to the application. NCPRROUTE does not have any of these.

Context-Specific

Used in ASN.1 constructors. Not applicable to NCPRROUTE.

Private-Use

NCPROUTE does not use any private tags.

The object's tag's field bits are formatted and displayed as the field. The field is either primitive or constructed.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

decode

EZB4126E	Modify command ignored, invalid client address
-----------------	---

Explanation

The target client specified in the MODIFY command is not valid.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Correct the address for the client target.

Module

NRMAIN

Procedure name

do_modify

EZB4127E	Modify command ignored, no session with client <i>client</i>
-----------------	---

Explanation

The target client specified in the MODIFY command is unknown. No session exists between NCPRUTE and the client.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Wait for NCPROUTE to establish a session with the NCP client or respecify the target client using an address known by NCPROUTE.

Module

NRMAIN

Procedure name

do_modify

EZB4128I	Reserved for addenda (<i>type</i>)
-----------------	---

Explanation

The type value is not a known object tag type. It was described as reserved for addenda in RFC 1158. See [Appendix A, “Related protocol specifications,” on page 1471](#) for information about accessing RFCs.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

decode

EZB4129I	<i>type</i>
-----------------	--------------------

Explanation

The formatted ASN.1 object tag's number. NCPROUTE formats Universal tags as defined in RFC 1158. See [Appendix A, “Related protocol specifications,” on page 1471](#) for information about accessing RFCs.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

decode

EZB4130I	Misc type type
-----------------	-----------------------

Explanation

This object’s class indicates that it is not a well-known type. The unformatted object type is displayed, NCPROUTE only formats objects with a class of Universal.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

decode

EZB4131I	Encountered editable OID at offset <i>offset</i>
-----------------	---

Explanation

An object identifier was located at the indicated offset into the packet. NCPROUTE will need to translate this OID to another region of the MIB tree so that the agent will recognize the request as being for one of NCPROUTE’s clients and not for the host running the agent.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

EZB4132I Length = *length*

Explanation

The length of the decoded ASN.1 object is displayed.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

decode

EZB4133I Adding *type route route destination via gateway gateway, metric metric*

Explanation

The indicated route, defined in the client's *hlq.ETC.GATEWAYS* data set, is added to the NCP's IP routing table. The route to the gateway will not be replaced by a competing RIP route.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSTART

Procedure name

gateways

EZB4134W

Subnetwork mask unknown for *destination*, using network route *route*

Explanation

The indicated subnetwork route, defined in the client's GATEWAYS data set, was explicitly coded as a "net" route type. Because the subnetwork mask for the destination subnetwork is unknown, NCPRROUTE replaces the subnetwork route with a network route. NCPRROUTE currently does not support variable subnetting.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRTABLES

Procedure name

nradd

EZB4135E

Invalid host or (sub)network address '*destination*'

Explanation

In the line entry for the client's *hlq.ETC.GATEWAYS* data set, the gateway definition has an incorrect destination address. The *destination* must be either a resolvable host name or an IP address in dotted notation. The gateway entry is ignored.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Correct the client's *hlq.ETC.GATEWAYS* data set.

Module

NRSTART

Procedure name

gateways

EZB4136W

Second element ignored, changing to 'active'

Explanation

The second element in the active gateway entry is detected to be incorrect. NCPRROUTE will change the element to be ACTIVE since it is likely that the gateway entry is in error. With this change, the active gateway entry is processed normally.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Correct the client's *hlq.ETC.GATEWAYS* data set.

Module

NRSTART

Procedure name

gateways

EZB4138W

Unknown next hop address *ipaddr* for route *destination* from router *router*

Explanation

An unknown next hop address *ipaddr* was received in a RIP packet for a route to *destination* from from *router*. The route is ignored.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Locate the router that produced the packet and correct the problem. It may involve router reconfiguration.

Module

NRINPUT

Procedure name

rip_input

EZB4139S**tblclr: no host hash table for client *client***

Explanation

A required host hash table could not be located for the client. NCPRROUTE was attempting to remove all routes for the specified client from its tables. Any routes will be left in NCPRROUTE's tables.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Contact IBM software support services.

Module

NRTABLES

Procedure name

tblclr

EZB4141S**tblclr: no network hash table for client *client***

Explanation

A required network hash table could not be located for the client, but the host hash table has already been found and cleared. NCPRROUTE was attempting to remove all network routes for the client from its tables. Any network routes for the client remain in NCPRROUTE's tables.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Contact IBM software support services.

Module

NRTABLES

Procedure name

tblclr

EZB4142E**The transmission of an 'Ack' to client *client* failed.**

Explanation

TCP/IP detected that an "Acknowledge" PDU could not be delivered successfully before any transmission was performed. The PDU is discarded. A more specific error message will immediately follow.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Examine the following error message and follow the documented procedures.

Module

NRPDUS

Procedure name

send_ack

EZB4143S

No SNMP_AGENT statement in profile

Explanation

A required SNMP_AGENT statement was missing from the NCPRROUTE profile. This statement must identify the host which runs the SNMP agent which NCPRROUTE will use to resolve queries. SNMP requests will not be honored by NCPRROUTE (or its clients).

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Correct the profile.

Module

NRMAIN

Procedure name

read_profile

EZB4144S

SNMP requests will not be honored.

Explanation

One or more severe errors were encountered which will result in a connection with the SNMP agent not being established. Until these errors are resolved, and NCPRROUTE is restarted, SNMP requests will not be honored by NCPRROUTE and its clients in turn.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Correct any previously identified errors.

Module

NRMAIN

Procedure name

read_profile

EZB4145S

* No SNMP_COMMUNITY statement in NCPROUTE profile

Explanation

A required `SNMP_COMMUNITY` statement is missing from the `NCPRROUTE` profile. This statement identifies the SNMP community which will be used when forwarding SNMP requests to the agent. SNMP requests will not be honored.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Correct the profile and restart NCPROUTE.

Module

NRMAIN

Procedure name

read_profile

EZB4146W

Required NCPROUTE profile dataset (*profile*) not found

Explanation

The optional profile configuration data set for NCPROUTE could not be opened successfully. This message indicates which data set the open was attempted on.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Verify that the profile data set is defined in //DD:NCPRPROF of the NCPROUTE start proc JCL and is accessible by NCPROUTE. If the data set is sequential, ensure that the FREE=CLOSE parameter is specified. Do not specify this parameter if the data set is partitioned.

Module

NRMAIN

Procedure name

read_profile

EZB4147S

Unknown keyword (*keyword*) in PROFILE

Explanation

An unknown keyword *keyword* was used in a statement in the NCPROUTE profile. The statement is ignored.

System action

EZB4154E	Invalid option: <i>option</i>
-----------------	--------------------------------------

Explanation

In the line entry for the client's *hlq*.ETC.GATEWAYS data set, the NCPROUTE's server options definition has an incorrect option. Although other options may be processed normally, the incorrect option is ignored.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Correct the client's *hlq*.ETC.GATEWAYS data set. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

NRSTART

Procedure name

gateways

EZB4155E	Invalid default router value: <i>value</i>
-----------------	---

Explanation

In the line entry for the client's *hlq*.ETC.GATEWAYS data set, the NCPROUTE's server options definition has an incorrect default router value. The incorrect default router value is ignored and the default value is used.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Correct the client's *hlq.ETC.GATEWAYS* data set by specifying a valid default router value. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

NRSTART

Procedure name

gateways

EZB4156E	Invalid trace level: <i>level</i>
-----------------	--

Explanation

In the line entry for the client's *hlq.ETC.GATEWAYS* data set, the NCPROUTE's server options definition has an incorrect trace level. The incorrect trace level is ignored and the default value is used.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Correct the client's *hlq.ETC.GATEWAYS* data set by specifying a valid trace level value. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

NRSTART

Procedure name

gateways

EZB4157E	Invalid <i>type</i> value: <i>value</i>
-----------------	--

Explanation

In the line entry for a client's *hlq.ETC.GATEWAYS* data set, the options definition contains an invalid value. Although other options may be processed normally, the invalid option is ignored.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Correct the client's *hlq.ETC.GATEWAYS* data set. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

NRSTART

Procedure name

gateways

EZB4158I**Global tracing at all levels suppressed**

Explanation

Trace levels for all NCP clients are not displayed. This includes the trace levels specified in the clients' *hlq.ETC.GATEWAYS* data set.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRTRACE

Procedure name

global_trace_start

EZB4159I**Global tracing actions started**

Explanation

Trace levels for all NCP clients have been advanced to the "actions" level, which causes messages to be issued for actions such as adding, changing, or deleting a route. Additional messages for actions such as waiting for incoming packets and dynamic updates are also issued. The trace levels specified in the client's *hlq.ETC.GATEWAYS* data sets are also advanced to this level.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRTRACE

Procedure name

global_trace_start

EZB4160I	Global tracing packets started
-----------------	---------------------------------------

Explanation

Trace levels for all NCP clients have been advanced to the "packets" level, which displays the types of packets sent and received in addition to the output displayed at the "actions" level. The trace levels specified in the client's *hlq.ETC.GATEWAYS* data sets are also advanced to this level.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRTRACE

Procedure name

global_trace_start

EZB4161T	Global trace levels exceeded maximum of 2 -t's. For each client, use the MODIFY command or GATEWAYS dataset to specify additional tracing options.
-----------------	---

Explanation

An incorrect number of trace levels (-t's) was passed from SEZAINST(NCPROUTE) start proc JCL. The parameter(s) could either be passed from the command line parameters or from the default parameter list in the start proc JCL.

System action

NCPROUTE exits.

Operator response

None.

System programmer response

Specify a correct number of *-t*'s in the command line parameters or in the default parameter list of the start proc JCL. If a higher trace level is required, specify the trace level in the options statement of a client's *hlq.ETC.GATEWAYS* data set. Another option is to use the MODIFY command to increase the trace levels for the client after NCPROUTE has started and established a session with the client. See [z/OS Communications Server: IP Configuration Reference](#) for more information.

Module

NRMAIN

Procedure name

parse_parms

EZB4162I	Deferring add route to <i>destination</i>
-----------------	--

Explanation

The addition of a new route to the specified destination in the NCP client's routing table is deferred until after the NCP client has finished initialization. The new route is copied to a static buffer, which is used after the Inactive Interface List PDU has been received from the NCP client. NCPROUTE will perform the add from the static buffer.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRPDUS

Procedure name

defer_add

EZB4163E	Too many deferred routes
-----------------	---------------------------------

Explanation

The number of static buffers to hold the new routes for deferred addition to the NCP clients' routing tables has exceeded the maximum of 500. This may happen when multiple NCP clients have not completed their initialization processes at the same time. At this time, the new routes are not added to the NCP client's routing tables. The static buffers do not become available until after NCPROUTE has received the Inactive Interface List PDUs from the NCP clients. These PDUs tell NCPROUTE that the NCP clients have completed their initialization processes.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Allow sufficient time for the NCP clients to complete their initialization processes so that the new routes can be added to the client's routing tables. Contact IBM software support services if the problem persists.

Module

NRPDUS

Procedure name

defer_add

EZB4164I	Init: compare with <i>client</i>
-----------------	---

Explanation

The client's IP address is being compared with one of NCPROUTE's session table entries for an exact match.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRPDUS

Procedure name

ncp_initialized

EZB4165E	Client <i>client</i> not in session table
-----------------	--

Explanation

The client's IP address was not found in the session table. This indicates that NCPROUTE has not established a session with the NCP client. NCPROUTE will not manage the routes for the client until a "Hello" PDU has been received for session establishment.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Allow sufficient time for the NCP client to issue the "Hello" PDUs so that a session can be established with NCPROUTE. If a Hello PDU was received and the problem persists, contact IBM software support services.

Module

NRPDUS

Procedure name

ncp_initialized

EZB4166I**Session with client *client* started**

Explanation

NCPROUTE has successfully established a session with the specified NCP client through the handshaking process and is waiting to receive an Inactive Interface List PDU from the client. This PDU indicates that the client has completed initialization and is ready for route table management by NCPROUTE.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRPDUS

Procedure name

recv_hello

EZB4167E**SNMP requester *requester* is not reachable by NCP client *client***

Explanation

NCPROUTE was ready to transport the SNMP response packet to the NCP client to be forwarded to the SNMP requester, but the route to the SNMP requester was detected to be unavailable. A possible cause is that the NCP client's interface to the SNMP requester became inactive. The SNMP response packet is discarded.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

Verify the status of the NCP client's interface to the SNMP requester. If the interface was inactive, activate the interface so that a route can be created; otherwise, determine whether the route to the SNMP requester was timed out. If the problem cannot be corrected, contact IBM software support services.

Module

NRSNMP

Procedure name

snmp_response

EZB4168I

SNMP lookup failed: *reason*

Explanation

NCPRROUTE could not obtain the routing information based upon the SNMP request packet sent by the SNMP requester. In this case, NO_SUCH_NAME is returned to the SNMP requester. Reasons for the failure are:

Reason

Explanation

NO INSTANCES PROVIDED

The target route was not specified in the SNMP request; however, this is an exception to SNMP GET_NEXT requests.

ROUTE TABLE EMPTY

There were no routing table entries for this interface based upon the target route.

ROUTE NOT FOUND

The target route was not found in the routing table.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

Verify the accuracy of the target route in the SNMP request. If the problem cannot be corrected, contact IBM software support services.

Module

NRSNMP

Procedure name

snmp_lookup

EZB4172I

SNMP reply sent to NCP client *client*

Explanation

NCPRROUTE is sending the reply containing the SNMP response packet to the NCP client to be forwarded to the SNMP requester.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_response

EZB4173I **SNMP get_next: no session with client *client***

Explanation

During processing of the SNMP GET_NEXT request, NCPRROUTE has detected that there was no session with the NCP client. The SNMP request packet is discarded.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

If the session with the NCP client appears to have terminated, examine previous messages to determine the cause. When necessary, take corrective actions to allow NCPRROUTE to process the SNMP requests for the NCP client.

Module

NRSNMP

Procedure name

get_next

EZB4174I **SNMP get_next: searching for next route after *target***

Explanation

During processing of the SNMP GET_NEXT request, NCPRROUTE is searching for the next route after the target route in the routing tables for the NCP client.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

get_next

EZB4175I	SNMP get_next: found next route <i>ip_addr</i>
-----------------	---

Explanation

During processing of the SNMP GET_NEXT request, NCPRROUTE has found the next route entry after the target route in the routing tables for the NCP client. The entry contains the next route's *ip_addr*.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

System programmer response

None.

Module

NRSNMP

Procedure name

get_next

EZB4177I **SNMP get_next: addresses matched**

Explanation

A match was found for the target route specified in the SNMP GET_NEXT request packet with one of NCPROUTE's routing table entries for an NCP client.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

get_next

EZB4178I **RIP2 authentication action at level level (interface)**

Explanation

RIP Version 2 authentication is enabled or disabled at the specified level for an interface for for all interfaces in the NCP client, or for all NCP clients.

System action

NCPROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRMAIN, NRSTART

Procedure name

read_profile, ParseOptions

EZB4179E

SNMP object length exceeded maximum 64K

Explanation

During the object data conversion process for an SNMP packet, NCPRROUTE detected an incorrect length value in the header portion of the object data. NCPRROUTE could not continue processing for the value has exceeded the maximum length of 64K. The SNMP packet may have been built incorrectly.

System action

NCPRROUTE exits.

Operator response

None.

System programmer response

Contact IBM software support services.

Module

NRSNMP

Procedure name

store_int

EZB4180I

Packet from router *router* ignored (filtered out)

Explanation

NCPRROUTE is ignoring the RIP packet as a result of being filtered out according to a RIP input or output filter defined in the NCP clients's gateways data set.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRINPUT

Procedure name

rip_input

EZB4181I

Interface *interface* skipped, interface is multicast-incapable

Explanation

The interface *interface* is skipped because the interface is not capable of multicasting RIP Version 2 packets. The RIP2 supply control has been configured for the interface and disallows the use of broadcasting RIP packets over the interface.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

When permitted, use the RIP2M supply control option to allow broadcasting RIP Version 1 packets over multicast-incapable interfaces and multicasting Version 2 packets over the multicast-capable interfaces.

Module

EZB4182I

SNMP request received from NCP client *client*

Explanation

An SNMP query request was received from an NCP client for processing. The NCP client had received the query request from its SNMP client or the SNMP requester.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

Module

NRSNMP

Procedure name

snmp_input

Explanation

NCPRROUTE is processing the SNMP GET_NEXT request but it could not obtain the routing information for the next route. In this case, NO_SUCH_NAME is returned to the SNMP requester. Reasons for the unavailable route are:

Reason**Explanation****NOT IN TABLE**

The target route was not found in the routing table. This implies that the route entry for the next route cannot be determined.

END OF TABLE

The target route was found at the end of the routing table but there were no more route entries for the next route.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

These reasons require the following responses:

Reason**Response****NOT IN TABLE**

Verify the accuracy of the target route in the SNMP request.

END OF TABLE

None.

If the problem cannot be corrected, contact IBM software support services.

Module

NRSNMP

Procedure name

snmp_lookup

Explanation

NCPRROUTE is performing the role as an SNMP sub-agent and is in session with the SNMP agent over the Distributed Program Interface (DPI). NCPRROUTE has received a DPI request from the SNMP agent for processing.

System action

NCPRROUTE continues.

Operator response

None.

System programmer response

None.

EZBH003E	TCPMAXRCVBUFRSIZE <i>bufsize</i> is less than the <i>deftype</i> specified <i>minval</i>
-----------------	---

Explanation

Check `CSTCP_TCPMAXRCVBUFRSIZE_tcpipstackname` determined that the configured TCP maximum receive buffer size is less than the minimum specified for the check.

If `owner` is specified in the message text, the configured value is not sufficient to provide optimal support to the z/OS Communications Server FTP Server.

The check name includes the jobname of the TCP/IP stack as a suffix.

In the message text:

bufsize

The value specified for the `TCPMAXRCVBUFRSIZE` parameter on the `TCPCONFIG` statement in the TCP/IP profile or modified using the `VARY TCPIP,,OBEYFILE` command.

deftype

Possible values are:

installation

The check parameters for this check have not been overridden.

owner

The check parameters for this check have been overridden.

minval

The check parameter value against which the `TCPMAXRCVBUFRSIZE` value is compared.

System action

The system continues processing. However, eventual action might need to be taken to provide optimal support to the z/OS Communications Server FTP server.

Operator response

Contact the system programmer.

System programmer response

Optimally, the z/OS Communications Server FTP server needs a buffer size of 180 KB for data connections. If z/OS Communications Server FTP server is being used on the stack reporting the problem, modify the TCPMAXRCVBUFRSIZE parameter on the TCPCONFIG statement in your TCP/IP profile to specify a value of at least 180 KB. To make this change effective immediately, use the VARY TCPIP,,OBEYFILE command, specifying a profile containing the modified TCPCONFIG statement.

See the information about the TCPCONFIG in [z/OS Communications Server: IP Configuration Reference](#) for more information about the TCPMAXRCVBUFRSIZE parameter.

See the information about the VARY TCPIP,,OBEYFILE command in [z/OS Communications Server: IP System Administrator's Commands](#) for more information about the VARY TCPIP,,OBEYFILE command.

EZBH006E

**GLOBALCONFIG SYSPLEXMONITOR RECOVERY was not specified when
IPCONFIG DYNAMICXCF or IPCONFIG6 DYNAMICXCF was configured**

Explanation

Check `CSTCP_SYSPLEXMON_RECOV_tcpipstackname` determined that the RECOVERY option was not specified for the GLOBALCONFIG SYSPLEXMONITOR parameter when IPCONFIG DYNAMICXCF or IPCONFIG6 DYNAMICXCF was specified in the TCP/IP profile.

IBM suggests that the SYSPLEXMONITOR RECOVERY option be specified when DYNAMICXCF is specified in the TCP/IP profile. Specifying this option allows a TCP/IP stack in a sysplex to perform internal checks and, if it is not healthy, remove itself from the sysplex, allowing a healthy backup TCP/IP stack to take over the ownership of the DVIPA interfaces to enable continued availability to applications.

The check name includes the job name of the TCP/IP stack as a suffix.

System action

The system continues processing.

Operator response

Contact the system programmer.

System programmer response

Change the GLOBALCONFIG SYSPLEXMONITOR parameter to specify RECOVERY when your TCP/IP profile specifies IPCONFIG DYNAMICXCF or IPCONFIG6 DYNAMICXCF. In [z/OS Communications Server: IP Configuration Reference](#) see the following information:

- The [GLOBALCONFIG statement](#) configuration statement for more information about the SYSPLEXMONITOR RECOVERY parameter.
- The [IPCONFIG statement](#) and [IPCONFIG6](#) configuration statements for more information about the DYNAMICXCF parameter

User response

Not applicable.

Problem determination

Use the NETSTAT CONFIG/-f command to display the current configuration setting for DYNAMICXCF and SYSPLEXMONITOR RECOVERY.

Example

Not applicable.

EZBH008E	The port range defined for CINET use has not been reserved for OMVS on this stack.
-----------------	---

Explanation

Check CSTCP_CINET_PORTRNG_RSV_*tcipstackname* determined that the port range defined for CINET use in the BPXPRMxx parmlib member is not reserved for OMVS on this stack.

IBM suggests that the port range specified by the INADDRANYPORT and INADDRANYCOUNT parameters in the BPXPRMxx parmlib member for use by CINET should be reserved for OMVS using the PORTRANGE TCP/IP profile statement. This prevents a TCP/IP stack from allocating a port that CINET might subsequently attempt to use, which might result in an ABEND and the message:

```
BPXF219I A SOCKETS PORT ASSIGNMENT CONFLICT EXISTS BETWEEN UNIX SYSTEM SERVICES AND tcipstackname
```

See [the section on ephemeral port reservations for multiple instances of TCP/IP in z/OS Communications Server: IP Configuration Guide](#) for more information about the reservations needed.

See the information about the [PORTRANGE](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the PORTRANGE statement.

See [for z/OS MVS Initialization and Tuning Reference](#) more information on the INADDRANYPORT and INADDRANYCOUNT parameters.

The check name includes the jobname of the TCP/IP stack as a suffix.

System action

The system continues processing.

Operator response

Determine the CINET INADDRANY port range by issuing

```
D OMVS,CINET
```

Contact the responsible system programmer to create a data set containing the PORTRANGE statements needed. Once available issue:

```
V TCPIP,tcpipstackname,OBEYFILE,filename
```

In the message text:

tcpipstackname

The name of the TCP/IP stack.

filename

The name of the OBEY file to reserve the CINET INADDRANY port range.

See the information about the [VARY TCPIP,,OBEYFILE](#) command in [z/OS Communications Server: IP System Administrator's Commands](#) for more information about the VARY TCPIP,,OBEYFILE command.

System programmer response

Determine the CINET INADDRANY port range by issuing:

```
D OMVS,CINET
```

Change the TCP/IP profile to include a PORTRANGE statement for both TCP and UDP to reserve the port range defined by the INADDRANYPORT and INADDRANYCOUNT parameters in the BPXPRMxx parmlib member for use by OMVS. Also, place these statements in a separate data set for use in an OBEYFILE command to have these reservations take effect immediately. For more information on OBEYFILE command, see the operator response section of this message.

EZBH010I

The current number of IPv4 indirect routes is below or equal to the maximum threshold (Current = *current_val* , High = *high_val* , Maximum = *maximum_val*)

Explanation

The CSTCP_IPMAXRT4_TCPIP*stackname* check ran successfully and found no exceptions. The check determined that the current number of IPv4 indirect static and dynamic routes in the TCP/IP stack routing table is within the maximum threshold value for this check. This message is issued after TCP/IP initialization and at the specified time intervals using the INTERVAL parameter of the IBM Health Checker for z/OS.

The check name includes the job name of the TCP/IP stack as a suffix.

current_val is the current number of IPv4 indirect routes in the TCP/IP stack routing table.

high_val is the highest recorded number of IPv4 indirect routes in the TCP/IP stack routing table during the time interval as defined in the INTERVAL parameter for the IBM Health Checker for z/OS.

maximum_val is the configured or default maximum threshold for the number of IPv4 indirect routes in the TCP/IP stack routing table as defined in the IPMAXRT4 parameter for the IBM Health Checker for z/OS.

```
EZBH010I The current number of IPv4 indirect routes is below or equal to the maximum threshold
(Current = 1000, High = 1500, Maximum = 2000)
```

EZBH011E

The current number of IPv4 indirect routes exceeds the maximum threshold (Current = *current_val* , High = *high_val* , Maximum = *maximum_val*)

Explanation

The CSTCP_IPMAXRT4_TCPIP*stackname* check determined that the current number of IPv4 indirect static and dynamic routes in the TCP/IP stack routing table is greater than the maximum threshold value for this check. The high number of routes might cause high CPU consumption from routing changes and less than optimal operations in OMROUTE and the TCP/IP stack. Actions should be taken to reduce the number of routes.

The check name includes the job name of the TCP/IP stack as a suffix.

current_val is the current number of IPv4 indirect routes in the TCP/IP stack routing table.

high_val is the highest recorded number of IPv4 indirect routes in the TCP/IP stack routing table during the time interval as defined in the INTERVAL parameter for the IBM Health Checker for z/OS.

maximum_val is the configured or default maximum threshold for the number of IPv4 indirect routes in the TCP/IP stack routing table as defined in the IPMAXRT4 parameter for the IBM Health Checker for z/OS.

System action

The system continues processing.

Operator response

Contact the system programmer.

System programmer response

To reduce the number of indirect OSPF routes, IBM suggests that the OSPF areas that contain the z/OS Communications Server application host or sysplex be configured as stub areas for optimal performance. Stub areas are used so that IPv4 route summaries from other areas are not flooded into the stub areas by the area border routers. See the [Minimizing the routing responsibility of z/OS Communications Server](#) information in [z/OS Communications Server: IP Configuration Guide](#).

Route filtering options for the address ranges in the areas are also available to control the OSPF route advertisements. See the [AREA statement](#) and the [RANGE](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the Stub_Area and Advertise parameters.

To reduce the number of indirect RIP or static routes, IBM suggests the configuration of RIP or static networks that contain the z/OS Communications Server application host or sysplex use route summarization and/or filters for optimal performance. Use of network-specific or default routes that represent the more specific indirect routes provides the route summarization.

Use of the RIPv2 option provides network masks in the RIP advertisements. Filtering options are also available to control the RIP route advertisements. See the [RIP_INTERFACE statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for information on RIPv2 and the receive filter parameters.

See the [BEGINROUTES statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for information on defining IPv6 prefixes or default routes. Modify the routes as necessary for route summarization. Then issue a VARY TCPIP,,OBEYFILE command with an OBEY file that contains the modified BEGINROUTES block.

GLOBALTCIPDATA was not specified when AUTOQUIESCE was specified.

Explanation

Check CSRES_AUTOQ_GLOBALTCIPDATA detected that the GLOBALTCIPDATA resolver setup statement was not specified when the AUTOQUIESCE operand was specified on the UNRESPONSIVETHRESHOLD resolver setup statement. The AUTOQUIESCE operand was ignored.

System action

The resolver uses the UNRESPONSIVETHRESHOLD percentage value to perform the network operator notification function instead of performing the autonomic quiescing of unresponsive name servers function.

Operator response

Contact the system programmer.

System programmer response

- If you do not want unresponsive name servers to be automatically quiesced, perform one of the following actions:
 - Remove the AUTOQUIESCE operand from the UNRESPONSIVETHRESHOLD statement, but leave the threshold percentage coded on the statement.
 - Remove the UNRESPONSIVETHRESHOLD statement completely. The network operator notification function will run by default.
 - Leave the resolver setup file unchanged. You will continue to see message EZBH015E every time the resolver is started or a MODIFY RESOLVER,REFRESH command is issued, but the autonomic quiescing function will not be active.
- If you want unresponsive name servers to be automatically quiesced, perform the following actions:
 - If you do not already have a global TCPIP.DATA file, create one. Code the appropriate resolver-related TCPIP.DATA statements in the global TCPIP.DATA file you just created.
 - Code the GLOBALTCIPDATA statement in the resolver setup file, specifying the name of the global TCPIP.DATA file to be used.

If you have corrected the resolver setup file, instruct the operator to issue the MODIFY RESOLVER,REFRESH,SETUP=*setup_file_name* command to activate the changes.

Automation

This message is a candidate for automation in cases where different resolver setup files are used to enable different resolver functions.

Example

```
EZBH015E - GLOBALTCIPDATA was not specified when AUTOQUIESCE was specified
```

EZBH016I

This check is not applicable when AUTOQUIESCE is not specified

Explanation

Check CSRES_AUTOQ_GLOBALTCIPDATA is not applicable when the AUTOQUIESCE operand is not specified on the UNRESPONSIVETHRESHOLD resolver setup statement.

System action

The system continues processing.

Operator response

None.

System programmer response

None.

User response

Not applicable.

Problem determination

Not applicable.

Source

z/OS Communications Server TCP/IP

Module

EZBHCK2

Routing code

Not applicable.

Descriptor code

Not applicable.

Automation

This message is not a candidate for automation.

Example

```
EZBH016I - This check is not applicable when AUTOQUIESCE is not specified
```

EZBH017I	The resolver timeout value is less than or equal to the <i>deftype</i> specified value of <i>timeout</i> when the autonomic quiescing of unresponsive name servers function is active
-----------------	--

Explanation

Check CSRES_AUTOQ_TIMEOUT ran successfully and found no exceptions. The check detected that the resolver timeout value is less than or equal to the *timeout* value specified for the check when the autonomic quiescing of unresponsive name servers function is active. This function is enabled by specifying the AUTOQUIESCE operand on the UNRESPONSIVETHRESHOLD resolver setup statement. The resolver timeout value is specified by using the RESOLVERTIMEOUT statement in the global TCPIP.DATA file. The default value is 5 seconds.

In the message text:

deftype

Indicates whether the maximum value for this check has been overridden by the user.

OWNER

The default maximum check value has not been overridden by the user.

INSTALLATION

The maximum check value has been overridden by the user.

timeout

The maximum check value against which the resolver timeout value is compared.

System action

The system continues processing.

Operator response

Source

z/OS Communications Server TCP/IP

Module

EZBHCK2

Routing code

Not applicable.

Descriptor code

Not applicable.

Automation

Not applicable.

Example

<pre>EZBH017I - The resolver timeout value is less than or equal to the installation specified value of 5 when the autonomic quiescing of unresponsive name servers function is active</pre>	
EZBH018E	The resolver timeout value is greater than the <i>deftype</i> specified value of <i>timeout</i> when the autonomic quiescing of unresponsive name servers function is active.

Explanation

Check CSRES_AUTOQ_TIMEOUT detected that the RESOLVERTIMEOUT statement is specified with a value greater than the *timeout* value specified for the check when the autonomic quiescing of unresponsive name servers function is active. This function is enabled by specifying the AUTOQUIESCE operand on the UNRESPONSIVETHRESHOLD resolver setup statement.

The default value for the RESOLVERTIMEOUT statement is 5 seconds. When the autonomic quiescing of unresponsive name servers function is active, the resolver polls unresponsive name servers every six seconds. The resolver uses the value from the RESOLVERTIMEOUT statement in the global TCPIP.DATA file, or the default value, to determine how long to wait for a response to the poll. If you specify a value for the RESOLVERTIMEOUT statement that is greater than 5 seconds, the resolver will be less efficient when polling unresponsive name servers.

In the message text:

deftype
Indicates whether the maximum value for this check has been overridden by the user.

OWNER
The default maximum check value has not been overridden by the user.

INSTALLATION
The maximum check value has been overridden by the user.

timeout
The maximum check value against which the resolver timeout value is compared.

System action

The system continues processing.

Operator response

If you want to continue using the autonomic quiescing function with the current RESOLVERTIMEOUT value, no action is needed.

If you no longer want to use the autonomic quiescing function, or the RESOLVERTIMEOUT value must be less than or equal to the *timeout* value, contact the system programmer.

System programmer response

If you want to use the autonomic quiescing function with the current RESOLVERTIMEOUT value, no action is needed.

If you want to use the autonomic quiescing function with a RESOLVERTIMEOUT value less than or equal to the *timeout* value, change the value on the RESOLVERTIMEOUT statement in the global TCPIP.DATA file. After the global TCPIP.DATA file has been corrected, instruct the operator to issue a MODIFY RESOLVER,REFRESH command to update the value.

If you no longer want to use the autonomic quiescing function, remove the AUTOQUIESCE operand from the UNRESPONSIVETHRESHOLD resolver setup statement in the resolver setup file. After the resolver setup file has been corrected, instruct the operator to issue a MODIFY RESOLVER,REFRESH,SETUP=*setup_file_name* command to stop the autonomic quiescing function.

Automation

This message is not a candidate for automation.

Example

```
EZBH019I - This check is not applicable when the autonomic quiescing of unresponsive name servers
function
is not active
```

EZBH020I

The resolver is using UDP to communicate with name servers when the autonomic quiescing of unresponsive name servers function is active.

Explanation

Check CSRES_AUTOQ_RESOLVEVIA ran successfully and found no exceptions. The check detected that the resolver is using UDP to communicate with the name server when the autonomic quiescing of unresponsive

name servers function is active. This function is enabled by specifying the AUTOQUIESCE operand on the UNRESPONSIVETHRESHOLD resolver setup statement. The protocol used by the resolver to communicate with name servers is specified by using the RESOLVEVIA statement in the global TCPIP.DATA file. The default value is UDP.

System action

The system continues processing.

Operator response

None.

System programmer response

None.

User response

Not applicable.

Problem determination

Not applicable.

Source

z/OS Communications Server TCP/IP

Module

EZBHCK2

Routing code

Not applicable.

Descriptor code

Not applicable.

Automation

This message is not a candidate for automation.

Example

```
EZBH020I - The resolver is using UDP to communicate with name servers when the autonomic quiescing of unresponsive name servers function is active
```

EZBH021E

The resolver is using TCP to communicate with name servers when the autonomic quiescing of unresponsive name servers function is active.

Explanation

Check CSRES_AUTOQ_RESOLVEVIA detected that the RESOLVEVIA statement is specified with the value TCP in the global TCPIP.DATA file when the autonomic quiescing of unresponsive name servers function is active. This

function is enabled by specifying the AUTOQUIESCE operand on the UNRESPONSIVETHRESHOLD resolver setup statement.

The default value for the RESOLVEVIA statement is UDP. If the autonomic quiescing of unresponsive name server function is active, the resolver polls unresponsive name servers by using UDP, not TCP. If your installation uses TCP to forward the DNS queries generated by an application to name servers, the results of the resolver polling attempts by using UDP will not accurately reflect the responsiveness of the name server in your installation.

System action

The system continues processing.

Operator response

If you want to continue using the autonomic quiescing function with RESOLVEVIA TCP, no action is needed.

If you no longer want to use the autonomic quiescing function, or the RESOLVEVIA value should be UDP, contact the system programmer.

System programmer response

If you want to use the autonomic quiescing function with RESOLVEVIA TCP, no action is needed.

If you want to use the autonomic quiescing function with RESOLVEVIA UDP, remove the RESOLVEVIA statement or change the value to UDP in the global TCPIP.DATA file. After the global TCPIP.DATA file is corrected, instruct the operator to issue a MODIFY RESOLVER,REFRESH command to update the value.

If you no longer want to use the autonomic quiescing function, remove the AUTOQUIESCE operand from the UNRESPONSIVETHRESHOLD resolver setup statement in the resolver setup file. After the resolver setup file has been corrected, instruct the operator to issue a MODIFY RESOLVER,REFRESH,SETUP=*setup_file_name* command to stop the autonomic quiescing function.

Automation

This message is not a candidate for automation.

Example

EZBH022I - This check is not applicable when the autonomic quiescing of unresponsive name servers function is not active

Explanation

Check processing for the TCP/IP check identified in the preceding IBM Health Checker for z/OS message failed as the result of an internal processing error.

The check name includes the job name of the TCP/IP stack as a suffix.

In the message text:

func_name

The name of the function that failed.

return_code

The failure return code that was returned by the function. It is displayed as 8 hexadecimal digits. These return codes are listed and described in the [Return codes \(errnos\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

reason_code

The failure reason code that was returned by the function. It is displayed as 8 hexadecimal digits. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

System processing continues. The check did not run for the specified stack.

Operator response

Contact the system programmer.

System programmer response

Use the return code and reason code values for the function specified to determine the cause of the failure and correct the problem. If the problem cannot be determined, or corrected, contact the IBM Software Support Center.

EZD0010I	ERROR: CODE= <i>Error_Code</i> DURING <i>Link_Control_Function</i> CONNECTION TO <i>addr</i> FOR INTERFACE <i>Interface_Name</i> DIAGNOSTIC CODE: <i>Internal_Diagnostic_Code</i>
----------	--

Explanation

The Link Layer has detected an error during activation of a virtual connection (VC) for an MPCPTP6 interface.

Error Code is the Data Link Control (DLC) Status Code for the link layer.

Link_Control_Function is the function being performed on the VC.

addr is the IPv6 address of the remote node.

Interface_Name is the name of the interface.

Internal Diagnostic Code is an internal diagnostic code for use by IBM.

System action

TCP/IP does not activate the VC.

Operator response

Consult the section on Data Link Control (DLC) Status Codes in [z/OS Communications Server: IP and SNA Codes](#) for a description of the status code for the link layer. If a hardware problem is indicated, correct the hardware problem and restart the MPCPTP6 interface.

System programmer response

Perform the action described in the [z/OS Communications Server: IP and SNA Codes](#) for the indicated status code.

Module

EZBIFIUT

Procedure name

IUT_MESSAGE

EZD0012I	DUPLICATE ADDRESS DETECTION PREVENTED BY IPSEC FOR <i>type</i> CONFIGURED HOME ADDRESS <i>addr</i> ON INTERFACE <i>intfname</i>
-----------------	--

Explanation

TCP/IP cannot verify the uniqueness of this IP address because the IPsec policy is preventing the stack from sending a neighbor solicitation packet for duplicate address detection.

In the message text:

type

Specifies how the home address was configured. Possible values are:

MANUAL

Indicates that the home address was manually configured in the TCP/IP profile.

AUTO

Indicates that the address is either a link-local automatically generated address or an automatically configured address.

addr

Specifies the address for which TCP/IP was attempting duplicate address detection.

intfname

The interface name.

System action

TCP/IP marks the home address as unavailable for use. If the home address is the link-local address, then TCP/IP deactivates the interface.

Operator response

Contact the system programmer.

System programmer response

Configure filter rules to permit neighbor solicitation and configure neighbor advertisement packets to enable duplicate address detection.

See the following in [z/OS Communications Server: IP Configuration Guide](#):

- The information about [special considerations when using IP security for IPv6](#) for more information about configuring IP filter rules
- The information about [setting up physical characteristics in PROFILE.TCPIP](#) for example filter rules
- The [Policy sample files](#) for example filter rules

EZD0019I	OSAENTA TRACE STOPPED FOR <i>osa_portname</i> - REASON: <i>reason</i> LIMIT REACHED
-----------------	--

Explanation

The stack reached one of the limits specified on the V TCPIP,OSAENTA command or the OSAENTA statement in PROFILE.TCPIP for OSA-Express network traffic analyzer trace collection, and stopped collecting trace data on this OSA-Express.

In the message text:

osa_portname

The value specified on the PORTNAME= parameter, which was specified on the OSAENTA command or statement.

reason

The specific limit that was reached. The limit was one of the following:

- DATA - amount of data traced
- FRAMES - number of frames traced
- RECORD - number of records traced
- TIME - length of time the trace was active

System action

TCP/IP stops collecting trace data on this OSA-Express. If the trace is restarted, the current OSAENTA settings remain in effect.

Operator response

Contact the system programmer.

System programmer response

To restart the trace, issue a VARY TCPIP,,OSAENTA command specifying the ON parameter or issue a VARY TCPIP,,OBEYFILE command with a TCP/IP profile that contains an OSAENTA statement specifying the ON parameter. See the information about the VARY TCPIP,,OSAENTA in [z/OS Communications Server: IP System Administrator's Commands](#) and the VARY TCPIP,,OSAENTA in [z/OS Communications Server: IP Configuration Reference](#) for more information.

**INTERFACE *interface_name* DOES NOT SUPPORT THE ISOLATE
FUNCTION**

Explanation

The ISOLATE parameter was specified on the INTERFACE statement for this device but the level of OSA-Express adapter microcode that is installed does not support the ISOLATE function.

In the message text:

interface_name

The name of the interface with the ISOLATE parameter specified.

System action

Interface activation fails.

Operator response

Contact the system programmer.

System programmer response

Either install a level of OSA-Express microcode that supports the ISOLATE function or remove the ISOLATE parameter from the INTERFACE statement. Use the VTAM DISPLAY TRL command to determine what level of the OSA-Express Licensed Internal Code (LIC) is currently installed. See the information about the [DISPLAY TRL command](#) information in [z/OS Communications Server: SNA Operation](#) for more information.

The ISOLATE function is limited to OSA-Express2 or OSA-Express3 ethernet features in QDIO mode and running at least an IBM System z9[®] Enterprise Class (EC) or z9 Business Class (BC). See the 2094, 2096, 2097, and 2098 DEVICE Preventive Service Planning (PSP) buckets for more information.

See the information about the INTERFACE-IPAQENET OSA-Express QDIO interfaces and the INTERFACE -- IPAQENET6 OSA-Express QDIO interfaces statement in [z/OS Communications Server: IP Configuration Reference](#) for information about OSA-Express connection isolation.

```

EZD0023I

**IPV6 MULTIPATH PERPACKET NOT VALID WITH IPV6 SECURITY – IPV6
MULTIPATH SUPPORT DISABLED FOR ROUTE TABLE *table***

Explanation

IPv6 multipath perpacket cannot be enabled for a policy-based route table when IPv6 security support is enabled on the TCP/IP stack.

In the message text:

table

The name of a policy-based route table

System action

TCP/IP continues. IPv6 multipath support is disabled for the specified route table.

Operator response

Contact the system programmer.

System programmer response

To use IPv6 multipath support with IPv6 security, enable IPv6 multipath per connection support by coding PerConnection on the Multipath6 parameter of the RouteTable statement in the policy configuration. See [Policy-based routing policy statements in z/OS Communications Server: IP Configuration Reference](#) for information about the RouteTable policy statement.

- IPV6 MULTIPATH SUPPORT DISABLED FOR ROUTE TABLE FTPRTES6
```

EZD0024I**DEVICE *device_name* DOES NOT SUPPORT VMAC**

Explanation

Virtual MAC (VMAC) was specified on the LINK statement for this device but the OSA-Express adapter microcode level does not support assigning Virtual MAC addresses. TCP/IP could not assign a VMAC address for this device during device activation.

In the message text:

device_name

The name of the device with VMAC configured.

System action

Device activation fails.

Operator response

Contact the system programmer.

System programmer response

Either install a level of OSA-Express microcode that supports the virtual MAC function or remove the VMAC parameter from the LINK statement. Use the VTAM DISPLAY TRL command to determine the currently installed OSA-Express Licensed Internal Code (LIC) level. See the information about the [DISPLAY TRL command](#) in [z/OS Communications Server: SNA Operation](#) for more information. See the 2094DEVICE Preventive Service Planning (PSP) bucket and the 2096DEVICE Preventive Service Planning (PSP) bucket for the OSA-Express LIC levels required for VMAC support. See the information about [OSA-Express Virtual MAC \(VMAC\) routing or workload balancing](#) in [z/OS Communications Server: IP Configuration Guide](#) for information about the networking affects of configuring with and without VMAC addresses.

Example

```
EZD0029I PATH MTU DISCOVERY SUPPORT IS DISABLED FOR ROUTE TABLE FTPRTES
EZD0030I                                     DISPLAY OSAINFO FAILED FOR name - reason
```

Explanation

The DISPLAY TCPIP,,OSAINFO request could not be processed for one of the reasons listed below.
In the message text:

name

The INTFNAME value specified on the DISPLAY TCPIP,,OSAINFO command.

reason

The reason for the error. Possible values are:

LINK OR INTERFACE DOES NOT EXIST

The LINK or INTERFACE name does not exist.

LINK OR INTERFACE DOES NOT SUPPORT DISPLAY OSAINFO

The LINK or INTERFACE does not support the DISPLAY TCPIP,,OSAINFO command.

LINK OR INTERFACE NOT ACTIVE

The OSA is not currently active.

COMMAND ALREADY IN PROGRESS

A DISPLAY TCPIP,,OSAINFO command is already in progress for the OSA

STORAGE NOT AVAILABLE

Storage required to complete the DISPLAY TCPIP,,OSAINFO request could not be obtained.

COMMAND TIMED OUT

The OSA has taken too long to reply with the information.

System action

Processing of the DISPLAY TCPIP,,OSAINFO command is discontinued.

Operator response

Not applicable.

System programmer response

For persistent COMMAND TIMED OUT failures, obtain a TCP/IP CTRACE with the VTAM option and contact IBM software support services.

User response

Follow the procedure described in the Problem Determination and re-submit the DISPLAY TCPIP,,OSAINFO command.

Problem determination

- If the *reason* value is LINK OR INTERFACE DOES NOT EXIST, issue the DISPLAY TCPIP,,NETSTAT,DEVLINKS
- If the *reason* value is LINK OR INTERFACE NOT ACTIVE, start the LINK or INTERFACE.
- "If the *reason* value is LINK OR INTERFACE DOES NOT SUPPORT DISPLAY OSAINFO, the LINK or INTERFACE is not OSA. DISPLAY TCPIP,OSAINFO is limited to OSA. OSA emulators (such as PDT or VSWITCH) may not support this command."
- If the *reason* value is COMMAND ALREADY IN PROGRESS, wait for the previous command to complete.
- If the *reason* value is STORAGE NOT AVAILABLE, determine and fix the reason for the storage shortage. See the information about the [diagnosing storage abends and storage growth](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for more information about storage problems.
- If the *reason* value is COMMAND TIMED OUT, the OSA is either extremely busy or an internal error occurred. If the failure persists contact the system programmer.

```

EZD0036I **DEVICE *device_name* DOES NOT SUPPORT DYNAMIC INBPERF**

Explanation

The value DYNAMIC was specified for the INBPERF parameter on the LINK statement for an OSA-Express adapter. The OSA-Express adapter microcode level does not support the INBPERF DYNAMIC setting.

In the message text:

device_name

The name of the device from the DEVICE statement.

System action

TCP/IP activates the device with the default INBPERF parameter setting BALANCED.

Operator response

Contact the system programmer.

System programmer response

Install a level of OSA-Express microcode that supports the dynamic LAN idle function. Use the VTAM DISPLAY TRL command to determine your current OSA-Express microcode level.

See the information about the [DISPLAY TRL command](#) in [z/OS Communications Server: SNA Operation](#) for information about the VTAM DISPLAY TRL command.

See the 2094DEVICE Preventive Service Planning (PSP) and the 2096DEVICE Preventive Service Planning (PSP) buckets for further information about which level of OSA-Express microcode supports the dynamic LAN idle function.

See the information about [DEVICE and LINK - MPCIPA OSA-Express QDIO devices](#) information in [z/OS Communications Server: IP Configuration Reference](#) for information about the INBPERF parameter.

If you choose to not use the dynamic LAN idle function, remove the DYNAMIC value from the LINK statement.

User response

Not applicable.

See the information about `INTERFACE -- IPAQENET6 OSA-Express QDIO` interfaces statement information in `z/OS Communications Server: IP Configuration Reference` for information about the `INBPERF` parameter.

If you choose to not use the dynamic LAN idle function, remove the `DYNAMIC` value from the `INTERFACE` statement.

```

EZD0038I	ERROR <i>error_code</i> UPDATING DYNAMIC INBPERF SETTINGS FOR <i>osa_portname</i>
-----------------	--

Explanation

An unexpected error occurred while dynamically updating the OSA-Express frequency of interruptions for inbound traffic.

In the message text:

error_code

The error code returned from the OSA-Express microcode.

osa_portname

The name of the device or the name of the `PORTNAME` parameter of the interface that encountered the error.

System action

The OSA-Express adapter will use the last successfully transmitted values to interrupt the host for inbound traffic.

Operator response

Contact the system programmer.

System programmer response

See *OSA Reject Codes and Internal Errors* in <https://www.ibm.com/docs/en/zos/2.3.0?topic=osa-z-systems-express-customers-guide-reference> for information about the OSA Reject Codes and a description of the error.

If the OSA-Express adapter experiences inbound performance problems, change the INBPERF setting from DYNAMIC to an alternate value on the LINK statement and INTERFACE statement representing this OSA-Express adapter. Then stop and restart the OSA-Express device and interface.

```

EZD0040I	INTERFACE <i>takeover_interface_name</i> HAS TAKEN OVER ARP RESPONSIBILITY FOR INACTIVE INTERFACE <i>inactive_interface_name</i>
-----------------	---

Explanation

An interface became inactive and TCP/IP detected another active interface on the same physical network that can take over ARP responsibility for the inactive interface. If the inactive interface becomes active again, then TCP/IP reassigns the ARP responsibility to that interface. See the information about [interface-layer fault-tolerance for local area networks \(interface-takeover function\)](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information about the interface-takeover function.

In the message text:

- takeover_interface_name***
The name of the interface that took over the ARP responsibility.
- inactive_interface_name***
The name of the inactive interface.

System action

TCP/IP assigns ARP responsibility for the inactive interface to the takeover interface. TCP/IP sends a gratuitous ARP for the IP address of the inactive interface and uses the takeover interface to reply to ARP requests on behalf of the inactive interface.

Operator response

None.

System programmer response

None.

EZD0042I	AUTOCONFIGURATION OF TEMPORARY ADDRESSES IS DISABLED FOR INTERFACE <i>interface_name</i>
----------	---

Explanation

The TCP/IP stack attempted three times to generate a temporary autoconfigured address and to verify that it was unique. During the verification of each of the generated temporary addresses, another node on the link indicated that it was already using the address. Autoconfiguration of temporary addresses is disabled.

In the message text:

interface_name

The name of the IPv6 interface for which autoconfiguration is disabled.

System action

TCP/IP continues.

Operator response

If temporary addresses are not necessary for this interface, no action is required. The interface remains active and autoconfigured public addresses are unaffected. If you want temporary addresses to be generated for the interface, contact the system programmer.

System programmer response

Use the INTERFACE ADDTEMPPREFIX configuration statement to enable temporary address autoconfiguration on the interface for a specific set of prefixes or for all prefixes. Issue a VARY TCPIP,,OBEYFILE command to update the configuration. See the information about the [INTERFACE statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information.

User response

Not applicable.

Problem determination

For each of the temporary addresses that was rejected, message EZZ9780I is generated.

Automation

This message goes to the console.

Example

```
EZD0042I AUTOCONFIGURATION OF TEMPORARY ADDRESSES IS DISABLED FOR INTERFACE QDI06
```

EZD0043I	RANDOM HISTORY VALUE FOR INTERFACE <i>interface_name</i> GENERATED BY <i>function</i> , ICSF <i>status</i> , ICSF RETURN CODE= <i>return_code</i> , ICSF REASON CODE= <i>reason_code</i>
-----------------	---

Explanation

When IPv6 temporary address autoconfiguration is supported for an interface, a random interface ID is generated for the interface. A history value is used as part of the algorithm to generate the random interface ID. The first time that an interface is started a random number generator is used to generate the history value.

If the cryptographic hardware is available, the Integrated Cryptographic Service Facility (ICSF) callable service CSNBRNG generates the history value. If the cryptographic hardware is not available or an error occurs using CSNBRNG, a software random number generator generates the history value.

In the message text:

interface_name

The name of the IPv6 interface for which the history value was generated.

function

Indicates whether the history value was generated by the ICSF callable service CSNBRNG random number generator or by a software random number generator.

status

Indicates whether ICSF is active.

return_code

The return code value, in hexadecimal format, that was returned by the ICSF service. This field is relevant only if the *status* value is ACTIVE. Otherwise, the value N/A is displayed.

reason_code

The reason code value, in hexadecimal format, that was returned by the ICSF service. This field is relevant only if the *status* value is ACTIVE. Otherwise, the value N/A is displayed.

System action

TCP/IP continues.

Operator response

Not applicable.

System programmer response

This is an informational message. No action is required.

If the history value was generated by a software random number generator and you want the value to be generated by the ICSF CSNBRNG random number generator, then use the ICSF status, return code, and reason code to determine the problem. When the problem is resolved, the ICSF CSNBRNG random number generator will be used to generate the next history value. The history value is generated only the first time that an interface is started after the TCP/IP stack is started.

User response

Not applicable.

Problem determination

If the *status* value indicates that ICSF is INACTIVE, start ICSF. If the ICSF return code or reason code is a nonzero value, then see the ICSF return and reason codes information in [z/OS Cryptographic Services ICSF Application Programmer's Guide](#) for the specific actions to be taken.

Source

z/OS Communications Server TCP/IP

Module

Not applicable.

Routing code

10

Descriptor code

12

Automation

This message goes to the console.

Example

In this example, ICSF is not active. A software random number generator generated the history value.

```
EZD0043I RANDOM HISTORY VALUE FOR INTERFACE QDI06 GENERATED BY SOFTWARE , ICSF INACTIVE ,  
ICSF RETURN CODE= N/A , ICSF REASON CODE= N/A
```

In this example, ICSF is active and the ICSF module CSNBRNG successfully generated the history value.

```
EZD0043I RANDOM HISTORY VALUE FOR INTERFACE QDI06 GENERATED BY CSNBRNG , ICSF ACTIVE ,  
ICSF RETURN CODE= 0 ICSF REASON CODE= 0
```

In this example, ICSF is active and an unsuccessful attempt was made to generate the history value using the ICSF module CSNBRNG. A software random number generator generated the history value.

```
EZD0043I RANDOM HISTORY VALUE FOR INTERFACE QDI06 GENERATED BY SOFTWARE , ICSF ACTIVE ,  
ICSF RETURN CODE= C , ICSF REASON CODE= 2B34
```

EZD0044I **INTERFACE *interface_name* NOT ALLOWED - *reason***

Explanation

The stack could not define the interface because the interface did not adhere to the rules for defining multiple VLAN interfaces to the same OSA port or HiperSockets CHPID. See the information about [OSA VLAN](#) or [HiperSockets and VLAN in z/OS Communications Server: IP Configuration Guide](#) for more information about these rules. This message provides more details for message EZZ0618I.

In the message text:

interface_name

The name of the interface.

reason

The reason for the rejection. Possible values are:

NO VLAN ID

The INTERFACE statement did not specify the VLANID parameter.

NO VLAN ID FOR AN EARLIER DEFINITION

A previous INTERFACE statement for the same OSA port did not specify the VLANID parameter.

VLAN ID NOT UNIQUE

The VLANID parameter on the INTERFACE statement conflicts with the VLANID parameter on a previous INTERFACE statement for the same OSA port.

NOT VMAC ROUTEALL

The INTERFACE statement did not specify the VMAC parameter value ROUTEALL.

NOT VMAC ROUTEALL FOR AN EARLIER DEFINITION

A previous INTERFACE statement for the same OSA port did not specify the VMAC parameter value ROUTEALL.

NO SUBNET MASK

The INTERFACE statement did not specify a subnet mask.

NO SUBNET MASK FOR AN EARLIER DEFINITION

A previous INTERFACE statement for the same OSA port did not specify a subnet mask.

SUBNET NOT UNIQUE

The subnet specified by the INTERFACE overlaps with the subnet specified by a previous INTERFACE statement for the same OSA port.

EXCEEDED MAXIMUM NUMBER OF VLANS

There are already 32 INTERFACE statements for the same OSA port for this IP version.

System action

TCP/IP continues with profile processing, but ignores this INTERFACE statement.

Operator response

Contact the system programmer.

System programmer response

Correct the TCPIP profile to adhere to the rules for defining multiple VLAN interfaces to the same OSA port and restart the stack.

EZD0044I INTERFACE OSAQDIO2 NOT ALLOWED - VLAN ID NOT UNIQUE
```

EZD0045I**INTERFACE *interface_name* DOES NOT SUPPORT OLM****Explanation**

The OLM parameter was specified on the INTERFACE statement for this device but the OSA-Express adapter microcode level does not support optimized latency mode.

In the message text:

Explanation

An error occurred while enabling optimized latency mode for the interface.

In the message text:

error_code

The error code returned from the OSA-Express microcode.

interface_name

The name of the interface.

System action

TCP/IP activates the device without optimized latency mode enabled.

Operator response

Contact the system programmer.

System programmer response

See *OSA Error Codes* in <https://www.ibm.com/docs/en/zos/2.3.0?topic=osa-z-systems-express-customers-guide-reference> for a description of the error code and potential action.

**ERROR *error_code* REGISTERING DVIPA *ipaddr* FOR SYSPLEX
DISTRIBUTOR WORKLOAD QUEUEING ON INTERFACE *interface_name***

Explanation

An error occurred while the stack was registering an IP address for sysplex distributor inbound workload queueing.

In the message text:

error_code

The OSA reject code that is returned from the OSA-Express microcode.

ipaddr

The distributed dynamic VIPA that was configured on a VIPADISTRIBUTE statement.

interface_name

The name of the OSA-Express QDIO interface that supports inbound workload queueing.

System action

Sysplex distributor traffic that is received over this interface for this distributed DVIPA is not eligible for inbound workload queueing. Instead, OSA-Express delivers this traffic to the stack using the primary input queue.

Operator response

Contact the system programmer.

System programmer response

See *OSA Error Codes* in <https://www.ibm.com/docs/en/zos/2.3.0?topic=osa-z-systems-express-customers-guide-reference> for a description of the error code and potential action.

EZD0048I

**INTERFACE *interface_name* DOES NOT SUPPORT QDIO INBOUND
WORKLOAD QUEUEING**

Explanation

The WORKLOADQ parameter was specified on the INTERFACE statement for this device in the TCP/IP profile. The OSA-Express adapter microcode level for this device does not support QDIO inbound workload queueing.

In the message text:

interface_name

The name of the interface.

System action

TCP/IP activates the device without QDIO inbound workload queueing enabled.

Operator response

Contact the system programmer.

System programmer response

Either install an OSA-Express Licensed Internal Code (LIC) level that supports QDIO inbound workload queueing or remove the WORKLOADQ parameter from the INTERFACE statement. QDIO inbound workload queueing is limited to OSA-Express3 ethernet features in QDIO mode (CHPID type OSD) that are running on an IBM z10. Use the VTAM DISPLAY TRL command to determine what OSA-Express LIC level is currently installed. See the information about the DISPLAY TRL command in [z/OS Communications Server: SNA Operation](#) for more information. See the 2097DEVICE Preventive Service Planning (PSP) bucket and the 2098DEVICE Preventive Service Planning (PSP) bucket for the OSA-Express LIC levels required for QDIO inbound workload queueing support.

See the information about the [QDIO inbound workload queueing](#) in [z/OS Communications Server: IP Configuration Guide](#) for information about the networking affects of configuring with and without the WORKLOADQ parameter.

EZD0049I	ERROR <i>error_code</i> REGISTERING IP ADDR <i>ipaddr</i> AND PORT <i>port</i> FOR EE WORKLOAD QUEUEING ON INTERFACE <i>interface_name</i>
-----------------	---

Explanation

An error occurred while the stack was registering an IP address and port for Enterprise Extender inbound workload queuing.

In the message text:

error_code

The OSA reject code returned from the OSA-Express microcode.

ipaddr

The static VIPA used for Enterprise Extender.

port

The UDP port used for Enterprise Extender.

interface_name

The name of the OSA-Express QDIO interface that supports inbound workload queueing.

System action

Enterprise Extender traffic that is received over this interface for this IP address and port is not eligible for inbound workload queuing. Instead, OSA-Express delivers this traffic to the stack by using the primary input queue.

Operator response

Contact the system programmer.

System programmer response

EZD0800I *proc_name IP ADDRESS ip_address IS NOT VALID FOR USE IN
ENTERPRISE EXTENDER*

Explanation

The IP address is not valid. The IP address was not defined to the TCP/IP stack or was defined as a loopback address.

proc_name is the name of the started task associated with the TCP/IP address space.

ip_address is the Internet protocol address defined in SNA for the Enterprise Extender connection.

System action

The Enterprise Extender connection using this IP address as the local address fails.

Operator response

None.

System programmer response

Ensure that the IP address for Enterprise Extender defined in SNA matches a static VIPA address defined in this TCP/IP stack. The IP address is defined in SNA using the IPADDR or HOSTNAME start options or the IPADDR or HOSTNAME GROUP operands in the XCA major node. For more information, see [z/OS Communications Server: SNA Resource Definition Reference](#).

Module

EZBUDBYP

Procedure name

OpenReq

EZD0801I	<i>proc_name</i> IP ADDRESS <i>ip_address</i> IS NOT A VALID STATIC VIPA ADDRESS
-----------------	---

Explanation

The local IP address requested for an Enterprise Extender connection is not defined as one of the static VIPA addresses in this TCP/IP stack.

proc_name is the name of the started task associated with the TCP/IP address

space. *ip_address* is the Internet protocol address defined in SNA for the Enterprise Extender connection.

System action

The Enterprise Extender connection using this IP address as the local address fails.

Operator response

None.

System programmer response

Ensure that the Enterprise Extender definitions defined in SNA match the static VIPA definitions in your TCP/IP profile. The IP address is defined in SNA using the IPADDR or HOSTNAME start options or the IPADDR or HOSTNAME GROUP operands in the XCA major node. EZD0802I

proc_name **ENTERPRISE EXTENDER CONNECTION FAILURE ON IP
ADDRESS *ip_address* REASON *reason***

Explanation

An Enterprise Extender connection using this IP address failed for the reason indicated.

In the message text:

proc_name

The name of the started task associated with the TCP/IP address space.

ip_address

The IP address defined in SNA for the Enterprise Extender connection.

reason

A code identifying the reason for the failure. Possible values are:

X'08'

The IP address requested or used by the caller is not a valid IP address for the stack.

X'0C'

The IP address requested or used by the caller is not a valid VIPA address for the stack.

X'10'

The port number requested by the caller cannot be reserved.

X'14'

The parameter passed by the caller is not valid for the requested operation.

X'18'

The state of the UDP connection is not valid for the requested operation.

X'1C'

The requested destination for the datagram is unreachable.

X'20'

The caller is not authorized to perform the requested operation.

X'24'

The requested operation cannot be completed as a result of a storage failure.

X'28'

The requested datagram to be sent exceeds the stack's maximum, or a received datagram has a data length of zero.

X'40'

The requested operation could not be completed because of a permanent error.

System action

The Enterprise Extender connection using this IP address as the local address fails.

System programmer response

Save the system log and contact IBM service.

User response

Contact the system programmer.

Module

EZBIFIUM

Procedure name

ClearMPC

EZD0810I	IPSec Suppressed logging of <i>number</i> packet message(s) due to buffer overflow: <i>timestamp</i>
-----------------	---

Explanation

The stack ipsec log buffer overflowed. Log entries for the number of packets indicated cannot be logged.

number is the number of log entries.

timestamp indicates when the buffer overflow occurred. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

System action

TCP/IP processing continues.

Operator response

Contact the system programmer.

System programmer response

You might be logging messages that are not required or your IP Security stack might be under a denial-of-service attack. Ensure that you are logging only items of interest. For example, broadcast messages should have a deny rule with the IpFilterLogging option set to no to prevent filling up the log. If you are under attack, log processing will return to normal when the attack ends.

Module

EZATRMD

Procedure name

trmd_ipsec_log

EZD0811I	Decapsulation failed: <i>timestamp</i> sipaddr= <i>sipaddr</i> dipaddr= <i>dipaddr</i> proto= <i>proto</i> vpnaction= <i>vpnaction</i> tunnelID= <i>tunID</i> AHSPI= <i>AHindex</i> ESPSPI= <i>ESPindex</i> rs= <i>rsn</i> ICSF Return Code= <i>return_code</i> ICSF Reason Code = <i>reason_code</i> ikeport= <i>ikeport</i>
-----------------	--

Explanation

The IPSec packet cannot be decapsulated by the receiving stack and is discarded.

timestamp indicates when the decapsulation failure occurred. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

sipaddr is the source IP address.

dipaddr is the destination IP address.

proto is the protocol. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- The protocol number

vpnaction is the vpnaction name. If no tunnel is found, *vpnaction* displays N/A.

- In the Policy Agent configuration file:
 - If the tunnel is a manual tunnel, *vpnaction* is the name specified on the IpManVpnAction statement.
 - If the tunnel is a dynamic tunnel, *vpnaction* is the name specified on the IpDynVpnAction statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, the *vpnaction* name corresponds to the name of the security level in the GUI. The *vpnaction* name also contains a suffix appended to the security level name to guarantee uniqueness.

tunID is the tunnel ID. If the value of *vpnaction* is N/A, a tunnel with matching end points and security parameter indices (spi) could not be found.

AHindex is the AH security parameter index.

ESPindex is the ESP security parameter index.

rsn indicates the specific reason decapsulation failed.

<i>rsn</i> Value	Explanation	Comments
1	Decryption failed	This problem might be caused by a transmission error or by a sender error. For manual tunnels, this might be the result of a policy definition error.
2	AH authentication failed	This problem might be caused by a transmission error or by a sender error. For manual tunnels, this might be the result of a policy definition error. This problem might also be caused by a failure in an ICSF service. If so, the specific failure will be reported on the ICSF Return Code and ICSF Reason Code fields.
3	ESP authentication failed	This problem might be caused by a transmission error or by a sender error. For manual tunnels, this might be the result of a policy definition error. This problem might also be caused by a failure in an ICSF service. If so, the specific failure will be reported on the ICSF Return Code and ICSF Reason Code fields.
4	Out of Replay window	A transmission error might have occurred or a packet might have been delayed.
6	Unknown authentication algorithm	An internal error occurred while authenticating the packet.

rsn Value	Explanation	Comments
7	Unknown encryption algorithm	An internal error occurred while decrypting the packet.
8	No tunnel found for AH SPI	<p>This message might be the result of a timing condition. On tunnel activation this message might be seen if packets are sent while one tunnel endpoint has the tunnel installed and the other tunnel endpoint does not. In this case, this is a transient condition and no action is required.</p> <p>For manual tunnels, this might be the result of a policy definition error. This message can also be the result of a transmission error or a sender error.</p>
9	No tunnel found for ESP SPI	<p>This message might be the result of a timing condition. On tunnel activation this message might be seen if packets are sent while one tunnel endpoint has the tunnel installed and the other tunnel endpoint does not. In this case, this is a transient condition and no action is required.</p> <p>For manual tunnels, this might be the result of a policy definition error. This message can also be the result of a transmission error or a sender error.</p>
10	More than one tunnel matched during decapsulation	<p>This might be due to one of the following problems:</p> <ul style="list-style-type: none"> • For manual tunnels, there is an error in the spi values specified in the policy definition. • The packet is protected by nested tunnels and z/OS is the endpoint for more than 1 of these tunnels. This configuration is not supported by z/OS
11	IPSec headers did not match tunnel definition	The policy, either the AH policy, the ESP policy, or both, defined for the tunnel did not match the IPSec protocols in the packet. For example, the policy specified encryption was required but no ESP header was found. For manual tunnels, this is most likely a policy definition error.
12	AH and ESP headers not in expected sequence	For manual tunnels, this might be a result of a policy definition error.
13	Storage shortage	Storage to complete the request is not currently available. Until the storage shortage is relieved, decapsulation will fail.
14	Encrypted data length is not a multiple of 8 bytes or 16 bytes if AES encryption or decryption is being used	This problem might be caused by a transmission error or by faulty encryption of the data by the sender.
15	No data was sent in the packet	This problem might be caused by a transmission error or by a sender error.
16	The packet is too small to contain the AH or ESP header	This problem might be caused by a transmission error or by a sender error.
17	Invalid IP option length	This problem might be caused by a transmission error or by a sender error.
18	UDP Encapsulation mismatch	Either the packet was UDP-encapsulated and the tunnel did not indicate UDP encapsulation or the packet was not UDP-encapsulated and the tunnel expected UDP encapsulation.

<i>rsn</i> Value	Explanation	Comments
19	Nested UDP-encapsulated headers	This configuration is not supported by z/OS.
24	Failure in ICSF Service	The ICSF Return Code and the ICSF Reason Code fields contain the return and reason codes that were returned from the ICSF service.
25	ICSF is not available	Either ICSF is not active or it has not completed initialization.
26	Encapsulation mismatch	The packet encapsulation did not match the local tunnel policy.

return_code is the return code value, in hexadecimal format, returned from the ICSF service.

reason_code is the reason code value, in hexadecimal format, returned from the ICSF service.

ikeport is the source port from the UDP encapsulation header. If the packet is not UDP encapsulated, the *ikeport* value is N/A.

System action

TCP/IP processing continues.

Operator response

Contact the system programmer.

System programmer response

The system programmer response depends on the *rsn* value:

<i>rsn</i> Value	System programmer response

EZD0814I	Packet permitted: <i>timestamp</i> filter rule= <i>rulename</i> ext= <i>instance</i> sipaddr= <i>sipaddr</i> dipaddr= <i>dipaddr</i> proto= <i>proto</i> tag1 <i>tag2</i> <i>tag3</i> Interface= <i>ifcaddr</i> (<i>dir</i>) secclass= <i>secclass</i> dest= <i>dest</i> len= <i>len</i> vpnaction= <i>vpnaction</i> tunnelID= <i>tunID</i> ifcname= <i>ifcname</i> fragment= <i>frag</i>
-----------------	--

Explanation

An IP packet matched the indicated filter rule and was permitted. For this message to be written, the matched filter rule must have IpFilterLogging set to yes.

timestamp is the stack timestamp that indicates the time at which the IP packet was processed by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename is the filter rule name. If the IP packet matched a dynamic filter rule, the rule name of the corresponding anchor filter rule will be displayed; otherwise, the rule name of the matching filter rule will be displayed.

- In the policy agent configuration file, *rulename* is the name specified on the IpFilterRule statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, *rulename* corresponds to the name of a Connectivity Rule in the GUI. *rulename* also contains a suffix appended to the Connectivity Rule name to guarantee uniqueness.

instance is the rule name extension that indicates which instance of the rule name was matched.

sipaddr is the source IP address.

dipaddr is the destination IP address.

proto is the protocol of the packet. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- MIPv6(135)
- Unknown
- The protocol number

The *tag1* value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag1* value is **type=** followed by the ICMP or ICMPv6 type, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag1* value is **sport=** followed by the source port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is OSPF, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the OSPF header is not present in the packet as the result of fragmentation.
- If the *proto* value is MIPv6, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the MIPv6 header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag1* value is **=** which indicates that the data is not applicable.

tag2 value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag2* value is **code=** followed by the ICMP or ICMPv6 code, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag2* value is **dport=** followed by the destination port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag2* value is **=** which indicates that the data is not applicable.

tag3 value varies depending on the *proto* value and direction.

- If the *proto* value is TCP or UDP, the direction is inbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original source port.
- If the *proto* value is TCP or UDP, the direction is outbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original destination port.
- If the *proto* value is any value not previously mentioned, the *tag3* value is **=** which indicates that the data is not applicable.

ifcaddr is the interface address over which the packet was received or sent.

dir is **I** if packet is inbound, **O** if packet is outbound.

secclass is the security class assigned to the interface. Security class is a numeric value in the range of 0–255.

dest is **local** if a local destination or **routed** if being routed.

len is the packet length.

vpnaction is the vpnaction name. If no tunnel is associated with the matched filter, *vpnaction* displays N/A.

- In the policy agent configuration file, the *vpnaction* value is one of the following:
 - If the tunnel is a manual tunnel, *vpnaction* is the name specified on the IpManVpnAction statement.
 - If the tunnel is a dynamic tunnel, *vpnaction* is the name specified on the IpDynVpnAction statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, the *vpnaction* name corresponds to the name of the security level in the GUI. The *vpnaction* name also contains a suffix appended to the security level name to guarantee uniqueness.

tunID is the tunnel ID.

ifcname is the interface name.

frag specifies whether the packet is a fragment. The value is Y if the packet is a fragment, or N if the packet is not a fragment.

**Packet denied by policy: *timestamp* filter rule= *rulename* ext= *instance*
sipaddr= *sipaddr* *dipaddr*= *dipaddr* *proto*= *proto tag1 tag2 tag3*
Interface= *ifcaddr* (*dir*) *secclass*= *secclass* *dest*= *dest* *len*= *len*
vpnaction= *vpnaction* *tunnelID*= *tunID* *ifcname*= *ifcname* *fragment*=
*frag***

Explanation

An IP packet matched the indicated deny filter rule. For this message to be written, the matched filter rule must have `IpFilterLogging` set to yes.

timestamp is the stack timestamp that indicates the time at which the IP packet was processed by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename is the filter rule name. If the IP packet matched a dynamic filter rule, the rule name of the corresponding anchor filter rule will be displayed; otherwise, the rule name of the matching filter rule will be displayed.

- In the policy agent configuration file, *rulename* is the name specified on the `IpFilterRule` statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, *rulename* corresponds to the name of a Connectivity Rule in the GUI. *rulename* also contains a suffix appended to the Connectivity Rule name to guarantee uniqueness.

instance is the rule name extension that indicates which instance of the rule name was matched.

sipaddr is the source IP address.

dipaddr is the destination IP address.

proto is the protocol of the packet. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- MIPv6(135)
- IPIP(94)
- Unknown
- The protocol number

The *tag1* value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag1* value is **type=** followed by the ICMP or ICMPv6 type, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag1* value is **sport=** followed by the source port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is OSPF, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the OSPF header is not present in the packet as the result of fragmentation.

- If the *proto* value is MIPv6, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the MIPv6 header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag1* value is **=** which indicates that the data is not applicable.

tag2 value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag2* value is **code=** followed by the ICMP or ICMPv6 code, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag2* value is **dport=** followed by the destination port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag2* value is **=** which indicates that the data is not applicable.

tag3 value varies depending on the *proto* value and direction.

- If the *proto* value is TCP or UDP, the direction is inbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original source port.
- If the *proto* value is TCP or UDP, the direction is outbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original destination port.
- If the *proto* value is any value not previously mentioned, the *tag3* value is **=** which indicates that the data is not applicable.

ifcaddr is the interface address over which the packet was received or sent.

dir is **I** if packet is inbound, **O** if packet is outbound.

secclass is the security class assigned to the interface. Security class is a numeric value in the range of 0–255.

dest is **local** if a local destination or **routed** if being routed.

len is the packet length.

vpnaction is the vpnaction name. If no tunnel is associated with the matched filter, *vpnaction* displays N/A.

- In the policy agent configuration file, the *vpnaction* value is one of the following:
 - If the tunnel is a manual tunnel, *vpnaction* is the name specified on the IpManVpnAction statement.
 - If the tunnel is a dynamic tunnel, *vpnaction* is the name specified on the IpDynVpnAction statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, the *vpnaction* name corresponds to the name of the security level in the GUI. The *vpnaction* name also contains a suffix appended to the security level name to guarantee uniqueness.

```

EZD0816I **IPSec Policy updated: *timestamp* type= *policy_type* status= *policy_status***

Explanation

The Pagent policy or Default policy was updated.

timestamp indicates the time the policy change occurred in the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

policy_type indicates the type of policy updated. Valid types are **Pagent** or **Default**.

policy_status indicates whether the policy type updated was active or inactive. Possible values are **Active** or **Inactive**. For example, if the default policy was updated but the policy that was active at the time of the update was provided by pagent, *policy_status* will be **Inactive**.

EZD0817I	IPSec Policy switched to <i>policy_type</i> policy: <i>timestamp</i>
-----------------	---

Explanation

The type of policy being used was changed as a result of the **ipsec -f default** or **ipsec -f reload** command.

policy_type indicates the type of policy that is now active as a result of the policy switch. Possible values are:

Pagent

Indicates that the new policy is the IPSEC policy defined in Pagent.

Default

Indicates that the new policy is the IPSEC policy defined in the TCP/IP configuration file.

timestamp indicates the time the policy change occurred in the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

EZD0818I	Tunnel added: <i>timestamp</i> vpnaction= <i>vpnaction</i> tunnelID= <i>tunID</i> AHSPI= <i>AHindex</i> ESPSPI= <i>ESPindex</i>
-----------------	--

Explanation

The specified tunnel was added to the stack.

timestamp indicates the time at which the tunnel was added by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

vpnaction is the vpnaction name.

- In the policy agent configuration file, the *vpnaction* value is one of the following:
 - If the tunnel is a manual tunnel, *vpnaction* is the name specified on the IpManVpnAction statement.
 - If the tunnel is a dynamic tunnel, *vpnaction* is the name specified on the IpDynVpnAction statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, the *vpnaction* name corresponds to the name of the security level in the GUI. The *vpnaction* name also contains a suffix appended to the security level name to guarantee uniqueness.

EZD0821I	Packet denied, no tunnel: <i>timestamp</i> filter rule= <i>rulename</i> ext= <i>instance</i> sipaddr= <i>sipadd</i> dipaddr= <i>dipaddr</i> proto= <i>proto</i> tag1 <i>tag2</i>
-----------------	---

***tag3 Interface= ifcaddr (dir) secclass= secclass dest= dest len= len
vpnaction= vpnaction ifcname= ifcname fragment= frag***

Explanation

An IP packet matched the indicated filter rule but no matching tunnel was found. For this message to be written, the matched filter rule must have IpFilterLogging set to **yes**.

timestamp is the stack timestamp that indicates the time at which the IP packet was processed by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename is the filter rule name. If the IP packet matched a dynamic filter rule, the rule name of the corresponding anchor filter rule will be displayed; otherwise, the rule name of the matching filter rule will be displayed.

- In the policy agent configuration file, *rulename* is the name specified on the IpFilterRule statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, *rulename* corresponds to the name of a Connectivity Rule in the GUI. *rulename* also contains a suffix appended to the Connectivity Rule name to guarantee uniqueness.

instance is the rule name extension that indicates which instance of the rule name was matched.

sipaddr is the source IP address.

dipaddr is the destination IP address.

proto is the protocol from the packet. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- MIPv6(135)
- Unknown
- The protocol number

The *tag1* value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag1* value is **type=** followed by the ICMP or ICMPv6 type, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag1* value is **sport=** followed by the source port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is OSPF, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the OSPF header is not present in the packet as the result of fragmentation.
- If the *proto* value is MIPv6, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the MIPv6 header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag1* value is **=** which indicates that the data is not applicable.

tag2 value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag2* value is **code=** followed by the ICMP or ICMPv6 code, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag2* value is **dport=** followed by the destination port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag2* value is **=** which indicates that the data is not applicable.

tag3 value varies depending on the *proto* value and direction.

- If the *proto* value is TCP or UDP, the direction is inbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original source port.
- If the *proto* value is TCP or UDP, the direction is outbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original destination port.
- If the *proto* value is any value not previously mentioned, the *tag3* value is **=** which indicates that the data is not applicable.

ifcaddr is the interface address over which the packet was received or sent.

dir is **I** if packet is inbound, **O** if packet is outbound.

secclass is the security class assigned to the interface. Security class is a numeric value in the range of 0–255.

dest is **local** if a local destination or **routed** if being routed.

len is the packet length.

vpnaction is the vpnaction name. If no tunnel is associated with the matched filter, *vpnaction* displays N/A.

- In the policy agent configuration file, the *vpnaction* value is one of the following:
 - If the tunnel is a manual tunnel, *vpnaction* is the name specified on the IpManVpnAction statement.
 - If the tunnel is a dynamic tunnel, *vpnaction* is the name specified on the IpDynVpnAction statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, the *vpnaction* name corresponds to the name of the security level in the GUI. The *vpnaction* name also contains a suffix appended to the security level name to guarantee uniqueness.

ifcname is the interface name

frag specifies whether the packet is a fragment. The value is Y if the packet is a fragment, or N if the packet is not a fragment.

System action

TCP/IP processing continues.

Operator response

Contact the system programmer.

System programmer response

For manual tunnels, verify that the IPSecurity policy defined a tunnel and that the time conditions are correct.

For dynamic tunnels, this can message can occur if the tunnel is not found and **AllowOnDemand No** is specified in the policy. If this traffic should be allowed, either activate the tunnel using the **ipsec** command or change the policy to allow OnDemand negotiations of Security Associations.

- In the policy agent configuration file, take the following actions:
 - Set the time conditions by using the IpTimeCondition statement. Time conditions can be included in an IpFilterRule statement or in an IpManVpnAction statement.
 - Set AllowOnDemand on either the IpFilterPolicy statement or on an IpLocalStartAction statement.

- When configured with the IBM Configuration Assistant for z/OS Communications Server, take the following actions:
 - Set the time conditions in the Advanced Settings panel of a security level that is defined as a manual tunnel or in the Connectivity Rule Advanced IPsec: Filter Logging / Effective Time panel
 - Set AllowOnDemand on the Connectivity Rule Advanced IPsec: Dynamic Tunnels: How to Activate panel.

----------	---

Explanation

An IP packet matched the indicated filter rule but the tunnel is not active. For this record to be written, the matched filter rule must have IpFilterLogging set to **yes**.

timestamp is the stack timestamp that indicates the time at which the IP packet was processed by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename is the filter rule name. If the IP packet matched a dynamic filter rule, the rule name of the corresponding anchor filter rule will be displayed; otherwise, the rule name of the matching filter rule will be displayed.

instance is the rule name extension that indicates which instance of the rule name was matched.

srcaddr is the source IP address.

dstaddr is the destination IP address.

proto is the protocol from the packet. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- MIPv6(135)
- Unknown
- The protocol number

The *tag1* value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag1* value is **type=** followed by the ICMP or ICMPv6 type, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag1* value is **sport=** followed by the source port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is OSPF, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the OSPF header is not present in the packet as the result of fragmentation.
- If the *proto* value is MIPv6, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the MIPv6 header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag1* value is **=** which indicates that the data is not applicable.

tag2 value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag2* value is **code=** followed by the ICMP or ICMPv6 code, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag2* value is **dport=** followed by the destination port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag2* value is **=** which indicates that the data is not applicable.

tag3 value varies depending on the *proto* value and direction.

- If the *proto* value is TCP or UDP, the direction is inbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original source port.
- If the *proto* value is TCP or UDP, the direction is outbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original destination port.
- If the *proto* value is any value not previously mentioned, the *tag3* value is **=** which indicates that the data is not applicable.

ifcaddr is the interface address over which the packet was received or sent.

dir is **I** if packet is inbound, **O** if packet is outbound.

secclass is the security class assigned to the interface. Security class is a numeric value in the range of 0–255.

dest is **local** if a local destination or **routed** if being routed.

len is the packet length.

vpnaction is applicable if a VpnAction name is associated with the matched filter. Otherwise, N/A will be shown. If the tunnel is a manual tunnel, this is the name specified on the IpManVpnAction statement. If the tunnel is a dynamic tunnel, this is the name specified on the IpDynVpnAction statement.

tunID is the tunnel ID.

ifcname is the interface name

frag specifies whether the packet is a fragment. The value is Y if the packet is a fragment, or N if the packet is not a fragment.

System action

TCP/IP processing continues.

Operator response

Contact the system programmer.

System programmer response

If the indicated tunnel should be active, use the **ipsec** command to activate the tunnel. See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

**UDP Encapsulated ESP packet can not be routed: *timestamp* sipaddr=
sipaddr dipaddr= *dipaddr* proto= *proto* vpnaction= *vpnaction* tunnelID=
tunID ESPSPI= *ESPindex***

Explanation

The final destination address of a UDP-encapsulated ESP packet is not local. Routing beyond the tunnel endpoint is not supported for this type of encapsulation.

timestamp is the stack timestamp that indicates the time at which the failure was detected by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time. This timestamp might be different than the syslogd message timestamp.

sipaddr is the public source IP address.

dipaddr is the destination IP address.

proto is the protocol from the decapsulated packet. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- OSPF(89)
- IPIP(94)
- The protocol number

vpnaction is the name specified on the IpDynVpnAction statement.

tunID is the tunnel ID.

ESPindex is the ESP security parameter index.

System action

The packet is dropped and TCP/IP processing continues.

Operator response

Contact the system programmer.

System programmer response

Ensure that the tunnel is defined correctly on the sending and receiving systems. See the information about IP security in [z/OS Communications Server: IP Configuration Guide](#) for information about defining IPSec tunnels. Use the **ipsec** command to display filter and tunnel information. See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

Module

EZATRZOS

Procedure name

trmd_ipsec_log

Explanation

A packet received over the specified tunnel contained a source IP address or source port that was different than the value at the time the tunnel was negotiated. If *origsipaddr* does not match *newsipaddr*, an address remapping might have occurred at the remote network address translation (NAT) device. If *origport* does not match *newport*, a port remapping might have occurred at the remote network address port translation (NAPT) device.

timestamp is the stack timestamp that indicates the time at which the failure was detected by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time. This timestamp might be different than the syslogd message timestamp.

origsipaddr is the IP address of the tunnel current remote endpoint.

newsipaddr is the source IP address from the inbound packet.

origport is the remote IKE peer port at the time the tunnel was negotiated.

newport is the remote IKE peer port from the UDP encapsulation header of the inbound packet.

dipaddr is the destination IP address from the inbound packet.

proto is the protocol from the decapsulated packet. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- OSPF(89)
- IPIP(94)
- The protocol number

vpnaction is the name specified on the IpDynVpnAction statement.

tunID is the tunnel ID.

tunID is the ESP security parameter index.

System action

The current inbound packet is dropped and processing is initiated to verify whether a NAT remapping actually occurred. Subsequent packets that do not match the tunnel current remote endpoint of the IKE peer port are also dropped. TCP/IP processing continues.

**Remote port translation failed: *timestamp* sipaddr= *sipaddr* dipaddr=
dipaddr proto= *proto* srcport=*srcport* dstport=*dstport* ikeport=*ikeport*
vpnaction= *vpnaction* tunnelID= *tunID* ESPSPI= *ESPindex* rsn= *rsn***

Explanation

An unsuccessful attempt was made to perform remote port translation. The *rsn* value provides additional information about the failure.

timestamp is the stack timestamp that indicates the time at which the failure was detected by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time. This timestamp might be different than the syslogd message timestamp.

sipaddr is the public source IP address.

dipaddr is the destination IP address.

proto is the protocol from the decapsulated packet. Possible values are:

- TCP(6)
- UDP(17)

srcport is the connection source port.

dstport is the connection destination port.

ikeport is the source port from the UDP encapsulation header.

vpnaction is the name specified on the IpDynVpnAction statement.

tunID is the tunnel ID.

ESPindex is the ESP security parameter index.

rsn is the reason code. Possible values are:

- 1**
The connection source port (*srcport*) in the inbound packet was already in use by another client with the same public source IP address. No alternate port was available.
- 2**
A storage shortage prevented an alternate port from being assigned.
- 3**
An internal error occurred during table lookup.
- 4**
An internal error prevented the port translation entry from being added.
- 6**
An internal error occurred when port translation was requested for a protocol that was not valid.
- 7**
An internal error prevented the port translation entry from being added.

System action

The packet is dropped and TCP/IP processing continues.

Operator response

Contact the system programmer.

System programmer response

The value of *rsn* determines the appropriate system programmer response.

- 1**
The translated port selection is limited to the port range specified in the filter policy that the packet matches. If a translated port could not be assigned, then the maximum number of ports specified in the filter policy are in use. Use the **ipsec** command to display the filter and the port translation entries.

See the information about managing network security in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

See the information about remote port translation in [z/OS Communications Server: IP Configuration Guide](#) for more information about port translation.

2

Determine the cause of the storage shortage. See [z/OS Communications Server: IP Diagnosis Guide](#) for information about storage shortages.

3

If this message appears repeatedly, take a dump of TCP/IP and contact the IBM Software Support Center.

4

If this message appears repeatedly, take a dump of TCP/IP and contact the IBM Software Support Center.

6

If this message appears repeatedly, take a dump of TCP/IP and contact the IBM Software Support Center.

7

If this message appears repeatedly, take a dump of TCP/IP and contact the IBM Software Support Center.

Remote port translated: *timestamp* sipaddr= *sipaddr* dipaddr= *dipaddr* proto= *proto* srcport= *srcport* dstport= *dstport* ikeport= *ikeport* xlateport= *xlateport* vpnaction= *vpnaction* tunnelID= *tunID* ESPSPI= *ESPI*index

Explanation

The connection source port in the inbound packet (*srcport*) was already in use by another client with the same public source IP address and a translated source port for this client was not already assigned. A translated source port (*xlateport*) is assigned and will be used to complete the connection. Subsequent packets from this client using the same source port will also use the translated port value specified by *xlateport*.

timestamp is the stack timestamp that indicates the time at which the failure was detected by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time. This timestamp might be different than the syslogd message timestamp.

sipaddr is the public source IP address.

dipaddr is the destination IP address at the time the translated source port was assigned. Subsequent packets using the translated port (*xlateport*) might have a different destination IP address.

proto is the protocol from the decapsulated packet. Possible values are:

- TCP(6)
- UDP(17)

srcport is the original connection source port.

dstport is the connection destination port at the time the translated source port was assigned. Subsequent packets using the translated port (*xlateport*) might have a different destination port.

ikeport is the source port from the UDP encapsulation header.

xlateport is the port assigned by IPsec processing that will be used on this stack in place of *srcport*.

vpnaction is the name specified on the IpDynVpnAction statement.

tunID is the tunnel ID.

ESPindex is the ESP security parameter index.

System action

TCP/IP processing continues.

Operator response

None.

System programmer response

None. This message is for informational purposes only. If it is necessary to obtain information about this connection from the client system, the original connection source port might be needed. The original source port can be found in this log message or by using the **ipsec** command to display the translated port information.

See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

See the information about [remote port translation in z/OS Communications Server: IP Configuration Guide](#) for additional information about port translation.

EZD0828I	TCP remote port translation mismatch:timestamp sipaddr=sipaddr dipaddr=dipaddr srcport=srcport dstport=dstport origport=origport originst =originst currinst=currinst
----------	---

Explanation

The remote port translation information at the time the connection was established does not match the information assigned to the current inbound packet. This can occur if the connection was initiated in the clear but is currently using a UDP-encapsulated tunnel or vice versa. If this is the case, the value of *originst* or *currinst* will be 0.

timestamp is the stack timestamp that indicates the time at which the failure was detected by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time. This timestamp might be different than the syslogd message timestamp.

sipaddr is the public source IP address.

dipaddr is the destination IP address.

srcport is the translated connection source port.

dstport is the connection destination port.

origport is the original connection source port from the inbound packet.

originst is the translated port instance ID at the time the connection was established.

currinst is the translated port instance ID assigned to the current packet.

System action

The packet is dropped and TCP/IP processing continues.

Operator response

Restart the TCP connection.

System programmer response

None.

Connections for DVIPA *ip_address* can not be recovered: *timestamp*

Explanation

The dynamic virtual IP address (DVIPA), which is one of the endpoints of a sysplex-wide Security Association (SWSA), is being taken over by another TCPIP stack. Any connection using a UDP-encapsulated tunnel, in which the IKE daemon can act only as the responder, for either the phase 1 SA or the phase 2 SA, cannot be recovered. Because the IKE daemon can act only as the responder, the UDP encapsulated tunnel cannot be recovered by the backup stack.

ip_address is the dynamic virtual IP address (DVIPA).

timestamp is the stack timestamp that indicates the time at which the failure was detected by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

System action

The TCPIP stack taking over the DVIPA is not informed about the connections. TCP/IP processing continues.

Operator response

Tunnel distribution failed : *timestamp* vpnaction= *vpnaction* tunnel ID= *tunID* AHSPI= *AHindex* ESPSPI= *ESPindex*

Explanation

The specified tunnel cannot be distributed because an error occurred while initializing data in the coupling facility.

timestamp is the stack timestamp that indicates the time at which the tunnel was added by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time. This timestamp might be different than the syslogd message timestamp.

vpnaction is the vpnaction name specified on the IpDynVpnAction statement.

tunID is the tunnel ID.

AHindex is the AH security parameter index.

ESPindex is the ESP security parameter index.

System action

TCP processing continues; the tunnel is not distributed but might be used on this system.

Operator response

Contact the system programmer. When the issue is resolved, refresh the indicated SA to allow distribution.

System programmer response

Ensure that the sysplex-wide Security Association (SWSA) coupling facility structure is set up correctly.

See the information about [Sysplex-wide Security Associations](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for information about diagnosing SWSA problems.

EZD0832I	Packet denied by NAT Traversal Processing: <i>timestamp</i> filter rule= <i>rulename</i> ext= <i>instance</i> sipaddr= <i>sipaddr</i> dipaddr= <i>dipaddr</i> proto= <i>proto</i> tag1 <i>tag1</i> tag2 <i>tag2</i> tag3 <i>tag3</i> Interface= <i>ifcaddr</i> (<i>dir</i>) dest= <i>dest</i> len= <i>len</i> vpnaction=<i>vpnaction</i> rsn=<i>rsn</i> ifcname= <i>ifcname</i> fragment= <i>frag</i>
-----------------	--

Explanation

An IP packet matched the indicated filter rule but further processing for NAT Traversal caused the packet to be denied. The *rsn* field provides more detailed information. For this message to be written, the matched filter rule must have IpFilterLogging set to **yes**.

timestamp is the stack timestamp that indicates the time at which the IP packet was denied by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename is the anchor filter rule name. The value of N/A is displayed when a target stack is processing an inbound packet that was received on the distributing stack as a UDP-encapsulated ESP packet. The packet was decapsulated by the distributor before the distributor forwarded it to the target stack.

instance is the rule name extension that indicates which instance of the rule name was matched. The value of N/A is displayed when a target stack is processing an inbound packet that was received on the distributing stack as a UDP-encapsulated ESP packet. The packet was decapsulated by the distributor before the distributor forwarded it to the target stack.

sipaddr is the source IP address.

dipaddr is the destination IP address.

proto is the protocol from the packet. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- OSPF(89)
- IPIP(94)
- MIPv6(135)

- Unknown
- The protocol number

The *tag1* value varies depending on the *proto* value:

- If the *proto* value is ICMP, the *tag1* value is **type=** followed by the ICMP type, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag1* value is **sport=** followed by the source port, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is OSPF, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the ICMP header is not present in the packet due to fragmentation.
- If the *proto* value is MIPv6, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the MIPv6 header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag1* value is **=** which indicates that the data is not applicable.

tag2 is one of the following:

- If the *proto* value is ICMP, the *tag2* value is **code=** followed by the ICMP code, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag2* value is **dport=** followed by the destination port, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag2* value is **=** which indicates that the data is not applicable.

tag3 value varies depending on the *proto* value and direction:

- If the *proto* value is TCP or UDP, the direction is inbound, and the port has been translated by the Communications Server NAT Traversal function, the *tag3* value is **origport=** followed by the original source port.
- If the *proto* value is TCP or UDP, the direction is outbound, and the port has been translated by the Communications Server NAT Traversal function, the *tag3* value is **origport=** followed by the original destination port.
- If the *proto* value is any value not previously mentioned, the *tag3* value is **=** which indicates that the data is not applicable.

ifcaddr is the interface address over which the packet was received or sent.

dir is **I** if packet is inbound, **O** if packet is outbound.

dest is **local** if a local destination or **routed** if being routed.

len is the packet length.

vpnaction is the name specified on the IpDynVpnAction statement for the referenced filter rule.

rsn is the reason code that indicates the specific NAT Traversal processing error. The *rsn* is one of the following:

<i>rsn</i> value	Affected packet	Explanation	Comments
1	Inbound TCP or UDP packet.	An internal error occurred when attempting to create a NAT Resolution Filter.	
2	Inbound TCP or UDP packet.	No storage could be allocated for a NAT Resolution Filter.	Storage to complete the request is not currently available. Until the storage shortage is relieved, packets will continue to be discarded.

rsn value	Affected packet	Explanation	Comments
3	Inbound TCP or UDP packet.	Unable to allocate a NAT Resolution Filter. The tunnel over which the packet was received cannot be found for the filter rule that the packet matched.	This could be the result of a policy mismatch between the peers. For example, an inbound packet that is received in the clear (for example, not encapsulated) but matches on a filter rule that specifies encapsulation.
4	Inbound non-TCP/UDP/ICMP packet	An inbound packet with a protocol not equal to TCP(6), UDP(17), or ICMP(1) matched on a NAT Traversal Anchor Filter.	When the IKE peer is a security gateway or the IKE peer is behind an NAPT, only inbound packets with a protocol value of TCP, UDP, or ICMP are supported over the UDP-encapsulated ESP tunnel.
5	Outbound TCP or UDP packet.	Unable to locate a matching NAT Resolution Filter.	When the IKE peer is a security gateway or the IKE peer is behind an NAPT, the NAT Resolution Filter is needed to determine which tunnel should be used for outbound packets. Data must be initiated from the client behind the security gateway or the client behind the NAPT.
6	Outbound non-TCP/UDP/ICMP packet	An outbound packet with a protocol not equal to TCP(6), UDP(17), or ICMP(1) matched on a NAT Traversal Anchor Filter.	When the IKE peer is a security gateway or the IKE peer is behind an NAPT, only outbound packets with a protocol value of TCP, UDP, or ICMP are supported over the UDP-encapsulated ESP tunnel.
7	Inbound ICMP packet	The tunnel over which the packet was received cannot be found for the filter rule that the ICMP packet matched.	This could be the result of a policy mismatch between the peers.
8	Outbound ICMP packet	Unable to locate the tunnel to use for the outbound packet. The outbound ICMP packet is not in response to an inbound packet.	When the IKE peer is a security gateway or the IKE peer is behind an NAPT, an outbound ICMP packet can be sent only over a UDP-encapsulated ESP tunnel in response to an inbound packet. For example, an Echo response can be sent in response to an Echo Request. Or an ICMP Port Unreachable message can be sent in response to an inbound UDP packet.

<i>rsn</i> value	Affected packet	Explanation	Comments
9	Outbound ICMP packet	Unable to locate the tunnel to use for the outbound packet. The outbound ICMP packet cannot use the same tunnel as the inbound request.	<p>When the IKE peer is a security gateway or the IKE peer is behind an NAT, an outbound ICMP packet can be encapsulated and sent over a tunnel if the following are true:</p> <ul style="list-style-type: none"> • The outbound packet is in response to an inbound packet and, • The tunnel used for the inbound packet can be used for the outbound packet <p>If, for example, separate tunnels are negotiated for UDP and ICMP traffic, an outbound ICMP port unreachable packet cannot be sent over the same tunnel as the inbound UDP packet that triggered the ICMP outbound packet. When the IKE peer is a security gateway or the IKE peer is behind an NAT and UDP-encapsulated ESP tunnels are being used, consideration should be given to using tunnels that encompass all protocols.</p>
10	Inbound or outbound TCP packet	Unable to accept the TCP packet because the IPSec policy for the TCP connection has changed. The connection was initiated as clear text traffic but is now using a UDP-encapsulated tunnel or vice versa.	When a TCP connection traverses a NAT, the connection must be restarted after a filter policy change that causes the connection's traffic to change from IPSec-protected traffic to clear text, or from clear text to IPSec-protected traffic.
11	Outbound packet	Unable to determine the local host public address for use in the IP header of the inner packet.	When the IKE peer is a security gateway and the NAT is in front of the local host, an outbound packet can be encapsulated and sent over a tunnel only if a packet has first been received inbound over the tunnel. Data must be initiated from the client behind the security gateway.
12	Inbound TCP or UDP packet	An internal error occurred when attempting to create a NAT Resolution Filter.	

ifcname is the interface name

frag specifies whether the packet is a fragment. The value is Y if the packet is a fragment, or N if the packet is not a fragment.

System action

The packet is dropped and TCP/IP processing continues.

Operator response

If the *rsn* value is 10, restart the TCP connection. Otherwise, contact the system programmer.

System programmer response

Unless a specific response is based on the *rsn* value shown in the following table, ensure that the filters and tunnel are defined correctly on the sending and receiving systems. Use the **ipsec** command to display filter and tunnel information.

<i>rsn</i> value	System programmer response
1	Contact the IBM Software Support Center.
2	Determine the cause of the storage shortage. See z/OS Communications Server: IP Diagnosis Guide information about storage shortages.

See the information about managing network security in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

EZD0833I

Packet denied, tunnel mismatch: *timestamp* filter rule= *rulename* ext= *instance* sipaddr= *sipaddr* dipaddr= *dipaddr* proto= *proto* tag1 tag2

**tag3 Interface= ifcaddr (dir) dest= dest len= len tunnelID= tunID
decap_tunnelID=decap_tunID ifcname= ifcname fragment= frag**

Explanation

An inbound IP packet matched the indicated filter rule but was denied because the packet was not encapsulated as specified in the filter rule. For this message to be written, the matched filter rule must have IpFilterLogging set to yes or logdeny.

timestamp is the stack timestamp that indicates the time at which the IP packet was denied by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename is the filter rule name. If the IP packet matched a dynamic filter rule, the rule name of the corresponding anchor filter rule will be displayed; otherwise, the rule name of the matching filter rule will be displayed.

- In the policy agent configuration file, *rulename* is the name specified on an IpFilterRule statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server *rulename* corresponds to the name of a Connectivity Rule in the GUI. *rulename* also contains a numeric suffix appended to the Connectivity Rule name to guarantee uniqueness.

instance is the rule name extension that indicates which instance of the rule name was matched.

sipaddr is the source IP address.

dipaddr is the destination IP address.

proto is the protocol from the packet. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- MIPv6(135)
- Unknown
- The protocol number

The *tag1* value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag1* value is **type=** followed by the ICMP or ICMPv6 type, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag1* value is **sport=** followed by the source port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is OSPF, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the OSPF header is not present in the packet as the result of fragmentation.
- If the *proto* value is MIPv6, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the MIPv6 header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag1* value is **=** which indicates that the data is not applicable.

tag2 value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag2* value is **code=** followed by the ICMP or ICMPv6 code, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag2* value is **dport=** followed by the destination port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag2* value is **=** which indicates that the data is not applicable.

tag3 value varies depending on the *proto* value and direction.

- If the *proto* value is TCP or UDP, the direction is inbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original source port.
- If the *proto* value is TCP or UDP, the direction is outbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original destination port.
- If the *proto* value is any value not previously mentioned, the *tag3* value is **=** which indicates that the data is not applicable.

ifcaddr is the interface address over which the packet was received or sent.

dir is **I** if packet is inbound, **O** if packet is outbound.

dest is **local** if a local destination or **routed** if being routed.

len is the packet length.

tunID is the tunnel ID for the tunnel specified by the filter rule. A value of N/A indicates that the filter rule permits the IP packet without IPsec protection.

decap_tunID is the tunnel ID for the tunnel used to decapsulate the IP packet. A value of N/A indicates that the IP packet was not IPsec encapsulated.

ifcname is the interface name

frag specifies whether the packet is a fragment. The value is Y if the packet is a fragment, or N if the packet is not a fragment.

System action

TCP/IP processing continues.

Operator response

Contact the system programmer.

System programmer response

Ensure that the filters and tunnel are defined correctly on the sending and receiving systems. Use the **ipsec** command to display filter and tunnel information. See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax.

Module

EZATRZOS

Example

```
EZD0821I Packet denied, no tunnel: 07/05/2007 16:19:44.39 filter rule= ipsec-2 ext= 1
sipaddr= 9.42.130.185 dipaddr= 10.1.1.1 proto= tcp(6) sport= 80 dport= 1026 -=
Interface= 9.1.1.1 (0) secclass= 255 dest= local len= 284 vpnaction= DynAction
ifcname= TRLE1AL fragment= N
```

Procedure name

trmd_ipsec_log

EZD0834I

**Encapsulation failed: *timestamp* sipaddr= *sipaddr* dipaddr= *dipaddr*
proto= *proto* vpnaction= *vpnaction* tunnelID= *tunID* rsn=*rsn* ICSF
Return Code= *return_code* ICSF Reason Code = *reason_code* AHSPI=
AHindex ESPSPI= *ESPindex***

Explanation

The IPSec packet cannot be encapsulated and is discarded.

In the message text:

timestamp

Indicates when the encapsulation failure occurred. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

sipaddr

The source IP address.

dipaddr

The destination IP address.

proto

The protocol. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- The protocol number

vpnaction

The vpnaction name.

- If configured with the IBM Configuration Assistant for z/OS Communications Server, the vpnaction name corresponds to the name of the security level in the GUI. The vpnaction name also contains a suffix that is appended to the security level name to guarantee uniqueness.
- If configured in the Policy Agent configuration file, the *vpnaction* value is one of the following:
 - If the tunnel is a manual tunnel, the *vpnaction* value is the name specified on the IpManVpnAction statement.
 - If the tunnel is a dynamic tunnel, the *vpnaction* value is the name specified on the IpDynVpnAction statement. If a tunnel is not found, the *vpnaction* value is N/A.

tunID

The tunnel ID. If the *vpnaction* value is N/A, a tunnel with matching end points and security parameter indices (spi) could not be found.

rsn

The specific reason encapsulation failed. The *rsn* value is one of the following:

rsn value	Explanation	Comments
1	Encryption error	An error occurred while trying to encrypt an outbound packet.
2	AH authentication error	An error was encountered when trying to authenticate an outbound packet. This problem might also be caused by a failure in an ICSF service. If so, the specific failure will be reported on the ICSF Return Code and ICSF Reason Code fields.
3	ESP authentication error	An error was encountered when trying to authenticate an outbound packet. This problem might also be caused by a failure in an ICSF service. If so, the specific failure will be reported on the ICSF Return Code and ICSF Reason Code fields.
4	Maximum packet exceeded	The addition of ESP headers will cause the maximum packet size to be exceeded.
5	Lifesize exceeded	The number of bytes in the outbound packet will cause the lifesize specification to be exceeded for the tunnel.
6	Unknown authentication algorithm	An internal error occurred while authenticating the packet.
7	Unknown encryption algorithm	An internal error occurred while encrypting the packet.
8	No tunnel found	A tunnel was not found for the specified tunnel ID.
9	Sequence numbers were not obtained	Sequence numbers could not be obtained from the coupling facility for a distributed tunnel.
10	IP header not valid	The IP header of the packet being encapsulated does not contain the same source and destination IP address as specified in the tunnel; transport mode is in effect.
13	Storage shortage	Storage to complete the request is not currently available. Until the storage shortage is relieved, encapsulation will fail.
24	Encryption failure in ICSF Service	The ICSF Return Code and the ICSF Reason Code fields contain the return and reason codes that were returned from the ICSF service.
25	ICSF is not available	Either ICSF is not active or it has not completed initialization.
26	Version mismatch	The IP version of the packet did not match the IP version of the tunnel.

<i>rsn</i> value	Explanation	Comments
27	Encapsulation using transport mode not valid for routed traffic	Encapsulation using transport mode was requested but the packet that is being processed is a routed packet. This is most likely the result of a policy definition error. For manual tunnels, this might occur if routed traffic matches a filter rule referencing an IpManVpnAction statement that specified the transport method HowToEncap. For IPv6, this might occur if a routing header contains an intermediate hop that routed the packet back through the packet's originating system. The tunnel endpoints matched the packet; however, the packet has been routed to this system.
28	Sequence number wrapped	The sequence number has wrapped, which indicates that the tunnel has expired. The tunnel will be deleted.
29	Sequence numbers were not obtained	Sequence numbers could not be obtained from the coupling facility for a distributed tunnel because a list entry is not allocated for the tunnel.
30	Sequence numbers were not obtained	Sequence numbers could not be obtained from the coupling facility for a distributed tunnel because VTAM is not active.

return_code

The return code value, in hexadecimal format, returned from the ICSF service.

reason_code

The reason code value, in hexadecimal format, returned from the ICSF service.

AHindex

The AH security parameter index. If the failure occurred before the AH SPI was known, then n/a is displayed.

ESPindex

the ESP security parameter index If the failure occurred before the ESP SPI was known, then n/a is displayed.

System action

The packet is discarded and TCP/IP processing continues.

Operator response

Contact the system programmer.

System programmer response

The response is based on the *rsn* value, as shown in the following table.

<i>rsn</i> value	System programmer response
1, 2, 3	<p>If the problem is transient, no action is required. For manual tunnels, verify that the security parameters and encryption keys on the IpManVpnAction statement are correctly defined. When configured with the IBM Configuration Assistant for z/OS Communications Server, the IpManVpnAction name corresponds to the name of the security level in the GUI. The IpManVpnAction name also contains a suffix that is appended to the security level name to guarantee uniqueness. For more details about the IpManVpnAction statement, see the information about Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference. Otherwise, ensure that the tunnel is defined correctly on the sending and receiving systems. Use the ipsec command to display filter and tunnel information. See the information about managing network security in z/OS Communications Server: IP System Administrator's Commands or issue the man ipsec command in a z/OS UNIX shell to obtain information about the ipsec command syntax and options.</p> <p>If the problem was due to an ICSF failure, then see the information about the ICSF and cryptographic coprocessor return and reason codes in z/OS Cryptographic Services ICSF Application Programmer's Guide for the specific actions to be taken.</p>
4	Contact the IBM Software Support Center.
5, 28	<p>If the problem is transient, no action is required. Otherwise, ensure that the tunnel is defined and activated correctly on the sending and receiving systems. Use the ipsec command to display filter and tunnel information. The ipsec command can also be used to refresh or activate a tunnel. See the information about managing network security in z/OS Communications Server: IP System Administrator's Commands or issue the man ipsec command in a z/OS UNIX shell to obtain information about the ipsec command syntax and options.</p>
6, 7, 8	Contact the IBM Software Support Center.
9,29,30	If the problem is transient, no action is required. Verify that z/OS VTAM is active and that the Coupling Facility is available and connected.
10	Contact the IBM Software Support Center.
13	Determine the cause of the storage shortage.
24	See the information about the ICSF and cryptographic coprocessor return and reason codes in z/OS Cryptographic Services ICSF Application Programmer's Guide for the specific actions to be taken.
25	Start ICSF if it is not active.
26	Contact the IBM Software Support Center.
27	<p>Ensure that the IPSec policy is defined correctly. Ensure that the filter rules for routed traffic do not reference VPN actions that request transport mode. EZD0835I IPv6 filters defined but IPv6 IPSECURITY support not enabled

Explanation

IPv6 IP filters were defined in the Policy Agent IP filter policy, but IPv6 IPSECURITY is not enabled on the IPCONFIG6 statement in the TCP/IP profile.

System action

IPv6 IP filters are discarded and IPv6 traffic is not subject to IP filtering. TCP/IP processing continues.

Operator response

Contact the system programmer.

System programmer response

Determine whether IPv6 IP filtering is necessary. If not, no action is necessary. If IPv6 IP filtering is necessary, enable it by coding the IPSECURITY option on the IPCONFIG6 statement in the TCP/IP profile. Restart the TCP/IP stack for this change to take effect. See the information about the IPCONFIG6 in the [z/OS Communications Server: IP Configuration Reference](#) for more information about specifying IP security for a stack.

EZD0836I Packet permitted: *timestamp sipaddr= sipaddr dipaddr= dipaddr proto= proto type= type code= code Interface= ifcaddr (dir) secclass= secclass dest= dest len= len tunnelID= tunID ifcname= ifcname embsipaddr=*

embsipaddr embdipaddr= embdipaddr embproto=embproto tag1 tag2 tag3

Explanation

An ICMP error packet did not match a filter rule but was permitted based on information in the embedded packet that caused the error. For an inbound packet, the packet was received over a tunnel and the selectors in the embedded headers matched the selectors for the tunnel. For an outbound packet, the original packet for which the ICMP message was generated was received over a tunnel and the outbound ICMP packet will be encapsulated using this tunnel. For this message to be issued, the IPFilterPolicy policy must have filter logging enabled.

In the message text:

timestamp

The stack timestamp that indicates the time at which the IP packet was handled by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

sipaddr

The source IP address.

dipaddr

The destination IP address.

proto

The protocol from the packet. Possible values are:

- ICMP(1)
- ICMPv6(58)

type

The ICMP or ICMPv6 type.

code

The ICMP or ICMPv6 code.

ifcaddr

The interface address over which the packet was received or sent.

dir

The possible values are I if the packet is inbound or O if the packet is outbound.

secclass

The security class assigned to the interface. Security class is a numeric value in the range 0 - 255.

dest

The possible values are local if the destination is local or routed if the destination is being routed.

len

The packet length.

tunID

The tunnel ID.

ifcname

The interface name.

embsipaddr

The source IP address from the embedded IP header.

embdipaddr

The destination IP address from the embedded IP header.

embproto

The protocol from the embedded IP header. Possible values are:

- ICMP(1)
- IGMP(2)

- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- MIPv6(135)
- Unknown
- The protocol number

tag1

The *tag1* value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag1* value is **type=** followed by the ICMP or ICMPv6 type.
- If the *proto* value is TCP or UDP, the *tag1* value is **sport=** followed by the source port.
- If the *proto* value is OSPF, the *tag1* value is **type=** followed by the type.
- If the *proto* value is MIPv6, the *tag1* value is **type=** followed by the typ.
- If the *proto* value is any value not previously mentioned, the *tag1* value is **=** which indicates that the data is not applicable.

tag2

tag2 value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag2* value is **code=** followed by the ICMP or ICMPv6 code.
- If the *proto* value is TCP or UDP, the *tag2* value is **dport=** followed by the destination port.
- If the *proto* value is any value not previously mentioned, *tag2* is **=** which indicates that the data is not applicable.

tag3

tag3 value varies depending on the *proto* value and direction.

- If the *proto* value is TCP or UDP, the direction is inbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original source port.
- If the *proto* value is TCP or UDP, the direction is outbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original destination port.
- If the *proto* value is any value not previously mentioned, the *tag3* value is **=** which indicates that the data is not applicable.

EZD0837I

Defensive filter packet denied messages limited: *date time filter_rule= rulename filter_ext= instance filter_sipaddr= sipaddr / sip_prefix_length filter_dipaddr= dipaddr / dip_prefix_length filter_proto= proto tag1 tag2 filter_fragmentonly= fragments_only filter_dir= dir filter_routing= routing suppressed_count= count*

Explanation

This message is issued when limiting of filter match messages was requested for a defensive filter and at least one "packet denied" message (EZD1721I) for the defensive filter was suppressed during the preceding five minutes.

In the message text:

date

The date on which this message was issued. This date is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

time

The time at which this message was issued. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rule

The defensive filter rule name as specified on the -N option when the defensive filter was added with the z/OS UNIX ipsec command.

instance

The rule name extension.

sipaddr / sip_prefix_length

The source IP address specification for the defensive filter rule. The value 0.0.0.0/0 indicates that the defensive filter rule applies to all source IPv4 addresses. The value ::/0 indicates that the defensive filter rule applies to all source IPv6 addresses.

dipaddr / dip_prefix_length

The destination IP address specification for the defensive filter rule. The value 0.0.0.0/0 indicates that the defensive filter rule applies to all destination IPv4 addresses. The value ::/0 indicates that the defensive filter rule applies to all destination IPv6 addresses.

proto

The protocol specification for the defensive filter rule. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- MIPv6(135)
- The protocol number
- ALL

tag1

The *tag1* value varies depending on the *proto* value.

If the *proto* value is ICMP or ICMPv6, the *tag1* value is type= followed by the ICMP or ICMPv6 type, or followed by the value all.

If the *proto* value is TCP or UDP, the *tag1* value is sport= followed by the source port range. For example, sport= 1024 - 65535. For a defensive filter that applies to all source ports the *tag1* value is sport= 1 - 65535.

If the *proto* value is any value not previously mentioned, the *tag1* value is -= which indicates that the data is not applicable.

tag2

The *tag2* value varies depending on the protocol.

If the *proto* value is ICMP or ICMPv6, the *tag2* value is code= followed by the ICMP or ICMPv6 code, or followed by the value all.

If the *proto* value is TCP or UDP, the *tag2* value is dport= followed by the destination port range. For example, dport= 21 - 21. For a defensive filter that applies to all destination ports, the *tag2* value is dport= 1 - 65535.

If the *proto* value is any value not previously mentioned, the *tag2* value is -= which indicates that the data is not applicable.

fragments_only

The fragment specification for the defensive filter rule. Possible values are:

- yes - The defensive filter rule applies only to fragments.
- no - The defensive filter rule does not apply only to fragments.

dir

The direction specified for the defensive filter rule. Possible values are inbound and outbound.

routing

The routing specified for the defensive filter rule. Possible values are local, routed, and either.

count

The number of "packet denied" messages (EZD1721I) for the defensive filter that were suppressed during the preceding five minutes.

System action

TCP/IP processing continues.

filter_proto= udp(17) sport= 301 - 301 dport= 1 - 65535 filter_fragmentsonly= no
filter_dir= inbound filter_routing= local suppressed_count= 125
```

EZD0838I

Defensive filter packet would have been denied messages limited:
date time filter_rule= rulename filter_ext= instance filter_sipaddr=
sipaddr / sip_prefix_length filter_dipaddr= dipaddr / dip_prefix_length
filter_proto= proto tag1 tag2 filter_fragmentsonly= fragments_only
filter_dir= dir filter_routing= routing suppressed_count= count

Explanation

This message is issued when limiting of filter match messages was requested for a defensive filter and at least one "packet would have been denied" message (EZD1722I) for the defensive filter was suppressed during the preceding five minutes.

In the message text:

date

The date on which this message was issued. This date is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

time

The time at which this message was issued. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename

The defensive filter rule name as specified on the -N option when the defensive filter was added with the z/OS UNIX ipsec command.

instance

The rule name extension.

sipaddr/sip_prefix_length

The source IP address specification for the defensive filter rule. The value 0.0.0.0/0 indicates that the defensive filter rule applies to all source IPv4 addresses. The value ::/0 indicates that the defensive filter rule applies to all source IPv6 addresses.

dipaddr/dip_prefix_length

The destination IP address specification for the defensive filter rule. The value 0.0.0.0/0 indicates that the defensive filter rule applies to all destination IPv4 addresses. The value ::/0 indicates that the defensive filter rule applies to all destination IPv6 addresses.

proto

The protocol specification for the defensive filter rule. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- MIPv6(135)
- The protocol number
- ALL

tag1

The *tag1* value varies depending on the *proto* value.

If the *proto* value is ICMP or ICMPv6, the *tag1* value is type= followed by the ICMP or ICMPv6 type, or followed by the value all.

If the *proto* value is TCP or UDP, the *tag1* value is sport= followed by the source port range. For example, sport= 1024 - 65535. For a defensive filter that applies to all source ports the *tag1* value is sport= 1 - 65535.

If the *proto* value is any value not previously mentioned, the *tag1* value is -= which indicates that the data is not applicable.

tag2

The *tag2* value varies depending on the protocol.

If the *proto* value is ICMP or ICMPv6, the *tag2* value is code= followed by the ICMP or ICMPv6 code, or followed by the value all.

If the *proto* value is TCP or UDP, the *tag2* value is dport= followed by the destination port range. For example, dport= 21 - 21. For a defensive filter that applies to all destination ports, the *tag2* value is dport= 1 - 65535.

If the *proto* value is any value not previously mentioned, the *tag2* value is -= which indicates that the data is not applicable.

fragments_only

The fragment specification for the defensive filter rule. Possible values are:

- yes - The defensive filter rule applies only to fragments.
- no - The defensive filter rule does not apply only to fragments.

dir

The direction specified for the defensive filter rule. Possible values are inbound and outbound.

routing

The routing specified for the defensive filter rule. Possible values are local, routed, and either.

filter_dir= inbound filter_routing= local suppressed_count= 125
```

EZD0839I	Connection reset: <i>date time filter rule= rulename ext= instance sipaddr= sipaddr dipaddr= dipaddr sport= sport dport= dport Interface= ifcaddr secclass= secclass ifcname= ifcname</i>
-----------------	--

Explanation

A TCP connection traversing a Shared Memory Communications over Remote Direct Memory Access (SMC-R) link matched the indicated filter rule and was reset. TCP connections that traverse SMC-R links and match a deny filter rule or a filter rule that specifies the use of IP security are reset. For this message to be written, the matched filter rule must have IpFilterLogging set to **yes**.

In the message text:

date

The date on which this message was issued. This date is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

time

The time at which this message was issued. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename

The filter rule name. If the TCP connection matched a dynamic filter rule, the rule name of the corresponding anchor filter rule is displayed; otherwise, the rule name of the matching filter rule is displayed.

- In the policy agent configuration file, *rulename* is the name specified on the IpFilterRule statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, *rulename* corresponds to the name of a Connectivity Rule in the GUI. *rulename* also contains a suffix appended to the Connectivity Rule name to guarantee uniqueness.

instance

The rule name extension that indicates which instance of the rule name was matched.

sipaddr

The source IP address of the TCP connection.

dipaddr

The destination IP address of the TCP connection.

sport

The source port of the TCP connection.

dport

The destination port of the TCP connection.

ifcaddr

The interface address over which the TCP connection was established.

secclass

The security class assigned to the interface. Security class is a numeric value in the range of 0 - 255.

ifcname

The name of the interface.

```

EZD0840I

Claim list failed: *date time* structure name= *structure_name*

Explanation

An attempt to claim a list in the identified EZBDVIPA coupling facility structure failed because a list was not available.

In a sysplex, an EZBDVIP coupling facility structure is required to support Sysplex-wide Security Associations (SWSA). Tunnel sequence numbers are stored in the EZBDVIP structure to enable sysplex distribution. Tunnel data is stored in the EZBDVIP structure to enable DVIPA takeover.

Depending on the number of DVIPAs and IPsec tunnels in use, TCP/IP can exhaust the number of lists defined in the EZBDVIP structure. After all lists are claimed, subsequent attempts to claim a list fail, which causes data traffic over the affected tunnel to fail if the traffic is distributed. Also, the affected tunnel cannot be recovered after a DVIPA takeover.

In the message text

date

The date on which this message was issued. This date is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This date might be different than the syslogd message date.

time

The time at which this message was issued. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This time might be different than the syslogd message time.

structure_name

The name of the EZBDVIP coupling facility structure for which the claim list failed.

Guideline: If subplexing is not in use, the name of the structure is EZBDVIP. If you use subplexing within your sysplex, the name is in the form EZBDVIPavvt, where vv is the VTAM group ID and tt is the TCP/IP group ID.

System action

TCP/IP continues. Data traffic over the affected tunnel fails if the traffic is distributed. The affected tunnel cannot be recovered after a DVIPA takeover.

Operator response

Contact the system programmer.

System programmer response

Issue D NET,STATS,TYPE=VTAM,STRNAME=structure_name on each VTAM in the sysplex to determine the number of lists in the coupling facility structure.

If message IST1189I appears in the DISPLAY STATS output, this indicates that VTAM might not have access to all the lists. For additional information on the DISPLAY STATS output, see the description of IST1189I under the first message in the display, IST1370I. See [Modifying the number of lists in z/OS Communications Server: SNA Network Implementation Guide](#) for instructions on how to adjust the number of lists that VTAM can access in the EZBDVIP structure.

If your configuration has a large number of DVIPAs and you expect a large number of tunnels between endpoints, see [Modifying the number of lists in z/OS Communications Server: SNA Network Implementation Guide](#) for instructions on how to increase the number of lists for the EZBDVIP structure.

Otherwise, evaluate your policy definitions to identify the reason for the unexpectedly large number of tunnels.

EZD0851I

**Unable to open message catalog *cat*:: errno *errno* (*description*) errnojr
errnojr - Default messages will be used**

Explanation

An attempt was made to open the command message catalog *cat* in the message catalog directory, but the catalog could not be opened for the specified reason. The default location for the message catalog is set by the NLSPATH environment variable to be NLSPATH=/usr/lib/nls/msg/%L/%N.

cat is the name of the catalog the **ipsec** command attempted to open.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errnos\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description describes the meaning of *errno*.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The **ipsec** command processing continues. Default messages will be used.

Operator response

If you want to use the message catalog, correct the indicated error. If the default messages are acceptable, no action is necessary.

System programmer response

If you want to use the message catalog, correct the indicated error. If the default messages are acceptable, no action is necessary.

Procedure name

None.

EZD0858I**Primary option -opt1 does not support option -opt2**

Explanation

The secondary option *opt2* is not allowed with the primary option *opt1*.

opt1 is the primary option of the command.

opt2 is the unsupported option that was used with *opt1*.

System action

The **ipsec** command processing ends.

Operator response

See the information about managing network security in *z/OS Communications Server: IP System Administrator's Commands* or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0859I**Requester is not authorized to perform the request**

Explanation

Different functions of the **ipsec** command require authorization with the system Access Control Facility. The requester does not have authority to perform the requested action.

System action

The **ipsec** command processing ends.

Operator response

This error is often caused by entering the wrong stack name with the -p option. Check the syntax, and if the problem persists, contact the system programmer to receive appropriate authority to use the **ipsec** command.

System programmer response

Give the user the appropriate authority to use the **ipsec** command. See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) for more information about the RACF® permission required by the **ipsec** command.

Module

ipsec.c

Procedure name

None.

EZD0860I	Stack <i>stackname</i> is not available : errno <i>errno</i> (<i>description</i>) errnojr <i>errnojr</i>
-----------------	---

Explanation

The identified stack could not be reached.

stackname is the stack that is unavailable.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description describes the meaning of *errno*.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The **ipsec** command processing ends.

Operator response

Ensure that the specified stack is valid and operational on the system.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0861I	Stack <i>stackame</i> is not configured for IPSECURITY
-----------------	---

Explanation

The identified stack is known to the system, but is not configured for IPSECURITY. The **ipsec** command interacts only with IPSECURITY stacks.

stackame is the name of the stack that is not configured for IPSECURITY.

System action

The **ipsec** command processing ends.

Operator response

Contact the system programmer to determine whether the specified stack is intended to have IPSECURITY.

System programmer response

Check the profile for the specified stack to insure that IPSECURITY is configured correctly. See the [z/OS Communications Server: IP Configuration Reference](#) for more information about specifying IPSECURITY for a stack.

Module

ipsec.c

Procedure name

None.

EZD0862I

**A system error kept the request from completing : errno *errno*
(*description*) errnojr *errnojr***

Explanation

The system failed to complete a request due to a system error as indicated by the *errno* information provided.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description describes the meaning of *errno*.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The **ipsec** command processing ends.

Operator response

The error might be transient and reissuing the request might succeed. If the error persists, contact the system programmer.

System programmer response

Trace or log entries might give more information about the nature of the error. Use *errno*, *description*, and *errnojr* to fix the problem.

Module

ipsec.c

Procedure name

None.

EZD0863I

File system access error : errno *errno* (*description*) errnojr *errnojr*

Explanation

The request required a file system access that could not be completed.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description describes the meaning of *errno*.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The **ipsec** command processing ends.

Operator response

The requester might not have the authority to perform the specified **ipsec** command action. Contact the system programmer to check authorization or about potential problems with the file system.

System programmer response

See the information about managing network security in [z/OS Communications Server: IP System Administrator's Commands](#) for information about **ipsec** command requirements.

Module

ipsec.c

Procedure name

None.

EZD0864I**Memory could not be obtained to complete the request**

Explanation

Memory could not be obtained to hold the system information that is being collected to satisfy the request.

System action

The **ipsec** command processing ends.

Operator response

The error might be transient and reissuing the request might succeed. If the error persists, contact the system programmer.

System programmer response

Trace or log entries might give more information about the nature of the error. Ensure that there is enough memory available on the system.

Module

ipsec.c

Procedure name

None.

EZD0865I	Could not set up signal handler : errno <i>errno</i> (<i>description</i>) errnojr <i>errnojr</i>
-----------------	---

Explanation

An error occurred during the establishment of a signal handler in support of the command request.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description describes the meaning of *errno*.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The **ipsec** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Correct the error indicated by *errno*, *errnojr*, or *description*. It might also be helpful to reissue the command with the debug (-d) option.

Module

ipsec.c

Procedure name

None.

EZD0866I	Stack <i>stackname</i> is not available - but request is allowed to continue
-----------------	---

Explanation

A reload/default filter function was requested for the specified stack, but this stack is not active on the system.

stackname is the name of the stack that is not available.

System action

The **ipsec** command is allowed to continue, but because the stack is unknown, the command might have no effect.

Operator response

Verify that the specified stack name is valid and reissue the command.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0867I**The ipsec command is not APF authorized**

Explanation

The **ipsec** command is an APF-authorized application, but the version of the executable does not have the APF bit set.

System action

The **ipsec** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Ensure that the **ipsec** command is installed correctly. Use the `extattr` command to ensure that the APF-authorized attribute is set to **on**.

Module

ipsec.c

Procedure name

None.

EZD0868I**Name length exceeds limit of *limit* and is ignored - name starts with *partialname***

Explanation

A name was found to exceed the maximum length allowed.

limit is the maximum length allowed for the name.

partialname is the beginning of the string that exceeded the allowable length.

System action

The **ipsec** command continues using the other names in the command specification.

Operator response

Correct the name and reissue the command.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0869I**Invalid tunnel ID *tunnelID* is ignored**

Explanation

The tunnel ID that was specified in the -a option is not in a valid format.

- The first character must be M, Y, or K, depending on the **ipsec** command that was issued:

-m command

A manual tunnel ID must be specified, and the first character must be M.

-y command

A dynamic tunnel ID must be specified, and the first character must be Y.

-k command

An IKE tunnel ID must be specified and the first character must be K.

-f command

Either a manual or dynamic tunnel ID can be specified and the first character can be either M or Y.

- The remaining characters must be numeric values in the range of 0–4294967295.

tunnelID is the tunnel ID that is not valid.

System action

Processing continues.

Operator response

Correct the tunnel ID and reissue the **ipsec** command.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0870I**Primary option *-opt1* conflicts with primary option *-opt2***

Explanation

Only one primary option can be specified.

opt1 and *opt2* are the primary option values that are in conflict.

System action

The **ipsec** command processing ends.

Operator response

See the information about managing network security in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0871I	All selection criteria were found in error
-----------------	---

Explanation

The **ipsec** command could not complete because all selection criteria entries were incorrect. Message EZD0869I is also issued for each name that is not valid.

System action

The **ipsec** command processing ends.

Operator response

Correct the specified names as indicated in the EZD0869I messages.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0872I	Scope <i>value</i> conflicts with selection criteria
-----------------	---

Explanation

The command as specified conflicts with the indicated scope value.
value is the specified scope and is either **current**, **policy**, or **profile**.

System action

The **ipsec** command processing ends.

Operator response

See the information about managing network security in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0873I	Function <i>function</i> conflicts with option <i>-option</i>
-----------------	--

Explanation

The function that the **ipsec** command is attempting to perform does not allow the specified option.

System action

The **ipsec** command processing ends.

Operator response

See the information about managing network security in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0875I	Selection criteria option <i>opt1</i> conflicts with selection criteria option <i>opt2</i>
-----------------	---

Explanation

On any command request, only one type of selection criteria option can be specified.
opt1 and *opt2* are the selection criteria option values in conflict.

System action

The **ipsec** command processing ends.

Operator response

See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0876I	Invalid <i>type</i> data specified
-----------------	---

Explanation

The IP Traffic Test option for the **ipsec -t** command contains an incorrect value.

type is the type of option that is incorrect. Possible values are:

- **SourceIpAddress**
- **DestIpAddress**
- **Protocol**
- **SourcePort**
- **DestinationPort**
- **Direction**
- **SecClass**

data is the incorrect data that was specified.

System action

The **ipsec** command processing ends.

Operator response

See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) for information about the correct values for the IP Traffic Test option of the **ipsec** command. Correct the IP Traffic Test option and reissue the command.

System programmer response

None.

Module

ipsec.c

Procedure name

do_traffictest

EZD0877I	<i>subfield</i> required for specified option
-----------------	--

Explanation

The IP Traffic Test option that was identified in the message for the **ipsec -t** command requires additional subfield data.

subfield is the name of the field that is missing data.

option is the IP Traffic Test option that requires the additional data.

System action

The **ipsec** command processing ends.

Operator response

See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) for information about the correct syntax for the IP Traffic Test option of the **ipsec** command. Correct the IP Traffic Test option and reissue the command.

System programmer response

None.

Module

ipsec.c

Procedure name

do_traffictest

EZD0878I**Excessive -t argument *arg* encountered**

Explanation

Following -t, the traffic test command takes a number of positional arguments as indicated by the syntax diagram. This message is issued because the specification of positional arguments does not follow the requirements of the syntax.

arg is the excessive data.

System action

The **ipsec** command processing ends.

Operator response

See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) for information about the correct syntax for the IP Traffic Test option of the **ipsec** command. Correct the IP Traffic Test option and reissue the command.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0879I**ipsec *function* cannot be issued while default policy is active**

Explanation

The requested ipsec function cannot be issued against default policy.

function is the requested ipsec function.

System action

The **ipsec** command processing ends.

Operator response

If this command is required, see the information about managing network security in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell for information about switching from the default policy.

System programmer response

None.

Module

ipsec.c

EZD0887I	IKE daemon could not process the request due to an internal error
-----------------	--

Explanation

A request was made to the IKE daemon that could not be completed.

System action

The **ipsec** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that covers the time of the command failure. If available, provide a CTRACE for component SYSTCPIK.

Module

ipsec.c

Procedure name

None.

EZD0888I	IKE daemon could not process the request - stack <i>stackname</i> is unknown to IKE daemon
-----------------	---

Explanation

The command specifies a stack that cannot be verified by the IKE daemon.
stackname is the name of the stack that cannot be verified.

System action

The **ipsec** command processing ends.

Operator response

Ensure that the stack name as specified is correct in the current system configuration. From the operator console, use the **d tcpip** command to list all available stacks.

System programmer response

None.

Module

ipsec.c

Procedure name

None.

EZD0889I	Could not create IKE daemon home directory <i>path</i> : errno <i>errno</i> (<i>description</i>) errnojr <i>errnojr</i>
-----------------	--

Explanation

Users of the **ipsec** command must have the authority to access the IKE daemon home directory.

path is the path of the IKE daemon home directory.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description describes the meaning of *errno*.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The **ipsec** command processing ends.

Operator response

Contact the system programmer.

System programmer response

See the information about [managing network security](#) in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and group access control requirements.

Module

ipsec.c

Procedure name

None.

EZD0890I	Could not open code page converters : errno <i>errno</i> (<i>description</i>) errnojr <i>errnojr</i>
-----------------	---

Explanation

Command execution requires a code page converter of IBM-1047 (EBCDIC) and a code page converter for the local code page.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description describes the meaning of *errno*.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The **ipsec** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Verify that code page converters are available for IBM-1047 and for the local code page. See the information about [code page conversion](#) in [z/OS UNIX System Services User's Guide](#) for more information about specifying code page converters.

Module

ipsec.c

Procedure name

None.

EZD0891I**Code page conversion failed and is ignored for *name***

Explanation

The **ipsec** command encountered a name that could not be converted.

name is the name that could not be converted.

System action

The **ipsec** command processing continues.

Operator response

Contact the system programmer.

System programmer response

See the information about [code page conversion](#) in [z/OS UNIX System Services User's Guide](#) for more information about specifying code page converters.

Module

EZD0898I	IKE daemon could not process the request due to a Security Association negotiation failure
-----------------	---

Explanation

A refresh or activation request could not be completed because of an error with the Security Association negotiation. The error might be a problem with the configuration or an internal error with the IKE daemon.

System action

The **ipsec** command processing ends.

System programmer response

Look at the syslog daemon syslog file that covers the time of the command failure. The negotiation failure might be caused by a configuration problem or by an internal error. Messages that see policy might indicate that the request failed because of the policy configuration. See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy. If the failure is caused by an IKE daemon internal error, contact IBM software support services and provide a syslog daemon syslog file that covers the time of the command failure. If available, provide a CTRACE for component SYSTCPIK. See the information about [diagnosing IKE daemon problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for more information about CTRACE.

User response

Contact the system programmer.

Module

ipsec.c

Procedure name

None.

EZD0902I

**Peer certificate failed validation - System SSL CMS error : *gsk_rc*
*description***

Explanation

A call to the System SSL Certificate Management Services (CMS) API to validate the peer certificate returned an error.

gsk_rc is the hexadecimal CMS status code. See the information about the [CMS status codes \(03353xxx\)](#) in [z/OS Cryptographic Services System SSL Programming](#).

description describes the meaning of *gsk_rc*.

System action

The operation being performed fails; IKE daemon processing continues.

Operator response

Save the IKED syslogd log file and contact the system programmer.

System programmer response

Use the following information to determine the error:

- *gsk_rc* and *description* from this message
- Check the log for message EZD2055I that provides additional information on the verification failure, including identification of the failing certificate.
- If needed, activate IkeSyslogLevel 4 to get DEBUGSA messages that identify the chain of certificates used in the failed verification.

See the IkeConfig statement in [z/OS Communications Server: IP Configuration Reference](#) for information about setting the IkeSyslogLevel.

Problem determination

See the System Programmer Response.

Module

pki390.cpp

Procedure name

None.

Example

```
EZD0902I Peer certificate failed validation - System SSL CMS error : 03353040 Self-signed certificate not in database
```

EZD0903I

**Peer certificate failed authentication - System SSL CMS error : *gsk_rc*
*description***

Explanation

A call to the System SSL Certificate Management Services (CMS) API to authenticate the peer certificate returned an error.

gsk_rc is the hexadecimal CMS status code. See the information about the [CMS status codes \(03353xxx\)](#) in [z/OS Cryptographic Services System SSL Programming](#).

description describes the meaning of *gsk_rc*.

System action

The operation being performed fails; IKE daemon processing continues.

Operator response

Use *gsk_rc* and the description provided to fix the error.

System programmer response

None.

Module

pki390.cpp

Procedure name

None.

EZD0904I	IKE CONFIGURATION FILE <i>fname</i> COULD NOT BE OPENED OR FILE DOES NOT EXIST
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon could not open the file name that was specified for IKE configuration.

fname is the name of the file that the IKE daemon could not open.

System action

If an error occurs during IKE startup, the IKE daemon configuration file processing is ended and the IKE daemon ends. If the error occurs due to a MODIFY REFRESH command, IKE daemon configuration file processing is ended, but the IKE daemon remains active. IKE configuration retains all values prior to the MODIFY REFRESH command.

Operator response

Verify that the file name provided is correct and that the file exists. See the information about the [IKE daemon](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IkeConfig statement and IKE daemon configuration file.

System programmer response

None.

Module

ike_config.cpp

Procedure name

None.

EZD0905I**IKE configuration file *fname* does not contain an IkeConfig statement**

Explanation

The Internet Key Exchange (IKE) daemon configuration file must specify an IkeConfig statement to indicate that there are IKE configuration parameters.

fname is the name of the IKE daemon configuration file.

System action

If the error occurs during IKE startup, IKE daemon configuration file processing ends, and the IKE daemon ends. If the error occurs due to a MODIFY REFRESH command, IKE daemon configuration file processing ends, but the IKE daemon remains active. IKE configuration retains all values prior to the MODIFY REFRESH command.

Operator response

Ensure that IkeConfig statement is specified in the configuration file. See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IkeConfig statement and IKE daemon configuration file.

System programmer response

None.

Module

ike_config.cpp

Procedure name

None.

EZD0906I**Unknown IKE configuration file parameter *pname* on line *linenum***

Explanation

The Internet Key Exchange (IKE) daemon configuration file contains a parameter that is not recognized by the IKE daemon.

In the message text:

pname

The unknown parameter.

linenum

The line of the configuration file where the parameter was found.

System action

If the error occurred during IKE startup, IKE daemon configuration file processing ends, and the IKE daemon ends. If the error occurred as the result of a MODIFY REFRESH command, the IKE daemon configuration file processing ends, but the IKE daemon remains active. IKE configuration retains all values prior to the MODIFY REFRESH command.

Operator response

Contact the system programmer.

System programmer response

Change the parameter specified by the *pname* value to a valid IKE parameter or remove that parameter. See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file.

User response

Not applicable.

Problem determination

None.

Example

```
EZD0906I Unknown IKE configuration file parameter junk on line 17
```

EZD0907I	Missing value for IKE configuration file parameter <i>pname</i> on line <i>linenum</i>
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon configuration file contains a parameter *pname* that requires a parameter value and no value was specified.

In the message text:

pname

The parameter name that is missing a value.

linenum

The line of the configuration file where the parameter was found.

System action

If the error occurs during IKE startup, IKE daemon configuration file processing ends, and the IKE daemon ends. If the error occurs as a result of a MODIFY REFRESH command, IKE daemon configuration file processing ends, but the IKE daemon remains active. IKE configuration retains all values prior to the MODIFY REFRESH command.

Operator response

Contact the system programmer.

System programmer response

Provide a value for the parameter specified by the *pname* value. See the information about the [IKE daemon](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file and valid parameters for the parameter specified by the *pname* value.

User response

Not applicable.

Problem determination

None.

EZD0910I	IKE configuration file was not specified - using defaults for all IKE configuration parameters
-----------------	---

Explanation

No Internet Key Exchange (IKE) daemon configuration file was found.

System action

The IKE daemon will use default values for all IKE daemon configuration parameters; the IKE daemon continues.

Operator response

If the intention was to use an IKE daemon configuration file, see the information about the [IKE daemon](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file.

System programmer response

None.

Module

ike_config.cpp

Procedure name

None.

EZD0911I	IKE CONFIG PROCESSING COMPLETE USING FILE <i>fname</i>
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon configuration file processing completed using file *fname*.
fname is the file name of the IKE daemon configuration file.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

ike_config.cpp

Procedure name

None.

EZD0912I

IKE configuration file contains more than one instance of non-repeatable parameter *parm* - value of last specified parameter will be used

Explanation

The Internet Key Exchange (IKE) daemon configuration file contains more than one instance of a non-repeatable parameter *parm*.

parm is the non-repeatable parameter that was specified more than once.

System action

The value of the last specified parameter will be used; IKE daemon processing continues.

Operator response

If this message was unexpected, see the information about the [IKE daemon](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file and which parameters are repeatable or non-repeatable.

System programmer response

None.

Module

ike_config.cpp

Procedure name

None.

EZD0913I

IKE configuration file parsing error - *explanation*

Explanation

The Internet Key Exchange (IKE) daemon encountered an error while parsing the IKE daemon configuration file. Possible errors are:

- **Unexpected end of file (EOF) encountered.**
- **Syntax errors in the IKE daemon configuration file.**

explanation describes the IKE daemon configuration file parsing error.

System action

If the error occurs during IKE daemon startup, IKE daemon configuration file processing is ends, and the IKE daemon ends. If the error occurs due to a MODIFY REFRESH command, IKE daemon configuration file processing ends, but the IKE daemon remains active. IKE daemon configuration retains all values prior to the MODIFY REFRESH command.

Operator response

Use *explanation* to fix the problem. See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file.

System programmer response

None.

Module

ike_config.cpp

Procedure name

EZD0915I**IKE DAEMON INITIALIZED WITH WARNINGS**

Explanation

The Internet Key Exchange (IKE) daemon initialized with non-fatal errors.

System action

IKE daemon processing continues.

Operator response

Examine the syslog for errors that occurred during the IKE daemon initialization that has the same message instance number as this message for more information. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System programmer response

None.

Module

main.cpp.

Procedure name

None.

EZD0917I**Could not find applicable KeyExchangeRule - LocalIp : *LSIP* RemoteIp :
RSIP LocalID : *LSID* RemoteID : *RSID***

Explanation

The Internet Key Exchange (IKE) daemon could not find an applicable KeyExchangeRule statement for the specified classification. The classification consists of the local security endpoint IP address (*LSIP*), remote

security endpoint IP address (*RSIP*), local security endpoint identity (*LSID*), and remote security endpoint identity (*RSID*). If the remote system is behind a NAT, ensure that the RemoteSecurityEndpoint location in the KeyExchangeRule is the public address of the remote system.

System action

The Security Association (SA) activation failed; IKE daemon processing continues.

Operator response

Add a suitable KeyExchangeRule statement for the classification to the IPsec policy, if necessary. See the information about [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

System programmer response

None.

Module

Problem determination

Not applicable.

Module

aes_obj.cpp

EZD0919I

**Local security endpoint IP address cannot be determined from IP
address range (*ip_range*) errid = *errid***

Explanation

While attempting to activate a dynamic tunnel, the IKE daemon could not determine the local security endpoint IP address for the tunnel. Usually this is caused by specifying IP addresses and the RemoteIpGranularity and LocalIpGranularity parameters on the IpLocalStartAction statement in the configuration policy that resolve to ranges of IP addresses.

ip_range is the address range from which the IKE daemon was trying to obtain the endpoint location.

errid is a unique error ID for the occurrence of this message.

System action

The dynamic tunnel activation failed; IKE daemon processing continues.

Operator response

Review and alter the IPsec configuration as necessary in order for the IKE daemon to be able to determine a local IP address. See the information about [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy. After you review your configuration, if you believe that the IKE daemon should be able to determine the source IP address, contact the system programmer.

System programmer response

Contact IBM software support services with the *errid* and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

policymgr.cpp

Procedure name

PMGet_Phase1Rule

EZD0920I

**Remote security endpoint IP address cannot be determined from IP
address range (*ip_range*) errid = *errid***

Explanation

While attempting to activate a dynamic tunnel, the IKE daemon failed to determine the remote security endpoint IP address for the tunnel.

ip_range is the address range from which the IKE daemon was trying to obtain the endpoint location.

errid is a unique error ID for the occurrence of this message.

System action

The dynamic tunnel activation failed; IKE daemon processing continues.

Operator response

Review and alter the IPSec configuration as necessary. See the information about Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy. After you review your configuration, if you believe that the IKE daemon should be able to determine the source IP address, contact the system programmer.

System programmer response

Contact IBM software support services with the *errid* and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

polycmgr.cpp

Procedure name

PMGet_Phase1Rule

EZD0922I **INTERNAL ERROR *errid* - *value1* | *value2* | *value3***

Explanation

The Internet Key Exchange (IKE) daemon detected an internal error.

Additional diagnostic messages that have the same message instance number might be issued. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

errid is a unique ID for this error.

value1 is optional error information.

value2 is optional error information.

value3 is optional error information.

System action

Results are unpredictable. One or more address space dumps are produced with dump titles that match the message text.

Operator response

Contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK. If available, provide any dumps associated with this message.

Module

None.

EZD0924I

Transform *transform_id* : unable to store Diffie-Hellman group
(*DH_group_id*) reason (*reason*)

Explanation

An IKE negotiation failed because the server was unable to store the specified Diffie-Hellman (DH) group identifier during the verification of the transforms in a proposal. This was caused by an unsupported protocol or group descriptor.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value that is used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

DH_group_id is the DH group ID. Only groups 1, 2, 5, and 14 are supported.

reason is either **protocol** or **descriptor**, which indicates whether the error was with the protocol or the group descriptor.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Request that the administrator of the remote security endpoint verify that only valid protocols and DH groups were specified.

System programmer response

None.

Module

ah_lf.cpp, esp_lf.cpp, oakley_lf.cpp

Procedure name

None.

EZD0925I	Transform <i>transform_id</i> : unsupported life-type attribute (<i>lifecycle_id</i>)
-----------------	--

Explanation

An IKE negotiation failed because the value specified for the life-type attribute is not in seconds or kilobytes.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value that is used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

lifecycle_id is the ID type of the unsupported life-type attribute.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Request that the administrator of the remote security endpoint ensure that their life-type values are specified as seconds or kilobytes.

System programmer response

None.

Module

ah_lf.cpp, esp_lf.cpp, gen.cpp, oakley_lf.cpp

Procedure name

None.

EZD0926I	Transform <i>transform_id</i> : key length specified for fixed key length algorithm or the algorithm is not supported
-----------------	--

Explanation

An IKE negotiation failed because a key length is specified for an algorithm that has a fixed key length or the algorithm is unsupported.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value that is used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Request that the administrator of the remote security endpoint verify that their transform algorithms are specified correctly.

System programmer response

None.

Module

ah_lf.cpp, esp_lf.cpp, oakley_lf.cpp

Procedure name

None.

EZD0927I**Transform *transform_id* : life value not specified for life-type attribute**

Explanation

An IKE negotiation failed because a transform specified a life-type attribute with no corresponding life value.

Additional diagnostic messages with the same message instance number will be issued to identify the impacted security association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value that is used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Request that the administrator of the remote security endpoint verify that they specified life values for all life-type attributes.

System programmer response

None.

Module

ah_lf.cpp, esp_lf.cpp, gen.cpp, oakley_lf.cpp

Procedure name

None.

EZD0928I**Transform *transform_id* : unsupported attribute tag (*attribute_tag*)**

Explanation

An IKE negotiation failed because a transform specified an attribute that is not known for the specified transform.

Additional diagnostic messages with the same message instance number will be issued to identify the impacted security association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value that is used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

attribute_tag is the ID that represents the unknown attribute.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Request that the administrator of the remote security endpoint verify that all the transforms are specified correctly.

System programmer response

None.

Module

ah_lf.cpp, esp_lf.cpp, gen.cpp, oakley_lf.cpp

Procedure name

None.

EZD0929I**Transform *transform_id* : attribute length (*attr_length*) incorrect size for attribute (*attribute*)**

Explanation

An IKE negotiation failed because a transform specified an attribute length that is the incorrect size for the specified attribute.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value that is used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

attr_length is the length of this attribute in bytes.

attribute is a string representation of the attribute. See the information about [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about transform attributes.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Request that the administrator of the remote security endpoint verify that their transforms are specified correctly.

System programmer response

None.

Module

ah_lf.cpp, esp_lf.cpp, oakley_lf.cpp, gen.cpp

Procedure name

None.

EZD0930I Transform *transform_id* : unable to read attribute

Explanation

An IKE negotiation failed because the length calculated for the next attribute is larger than the remaining attribute string.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value that is used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Request that the administrator of the remote security endpoint verify that their transforms are configured correctly.

System programmer response

None.

Module

ah_lf.cpp, esp_lf.cpp, oakley_lf.cpp

Procedure name

None.

EZD0931I**Transform *transform_id* : no encapsulation mode specified**

Explanation

An IKE negotiation failed because the specified transform does not specify tunnel or transport mode.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value that is used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement. Phase 2 transforms specify the encapsulation mode on the HowToEncap statement.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Request that the administrator of the remote security endpoint verify that they specified tunnel or transport mode for this negotiation.

System programmer response

None.

Module

ah_lf.cpp, esp_lf.cpp

Procedure name

None.

EZD0932I**Transform *transform_id* : no authentication algorithm specified**

Explanation

An IKE negotiation failed because the specified transform does not specify an authentication algorithm.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value that is used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Request that the administrator of the remote security endpoint ensure that an authentication algorithm is specified for each transform.

System programmer response

None.

Module

gen.cpp, ah_lf.cpp

Procedure name

None.

EZD0933I	Transform <i>transform_id</i> : no hash algorithm specified
-----------------	--

Explanation

An IKE negotiation failed because the specified transform does not specify a hash algorithm.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value that is used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Request that the administrator of the remote security endpoint ensure that a hash algorithm is specified for each transform.

System programmer response

None.

Module

gen.cpp, oakley_lf.cpp

Procedure name

None.

EZD0934I	Unsupported exchange type (<i>xchg_id</i>) for phase 1 security association
-----------------	--

Explanation

An IKE negotiation failed because the IKE daemon encountered an unsupported exchange type.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted security association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

xchg_id is the number that identifies the exchange type that was not valid.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to ensure that a supported exchange type is used in negotiations.

Module

policy.cpp

Procedure name

None.

EZD0935I **No local policy data available**

Explanation

An IKE negotiation failed because the IKE daemon found no suites for matching proposals.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Check the local policy and ensure that it exists and is valid. Local policies are specified on KeyExchangeAction and IpDataOffer Statements. See the information about [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

System programmer response

None.

Module

policy.cpp

Procedure name

None.

EZD0936I **Phase 2 IDs must be IP type addresses**

Explanation

An IKE negotiation failed because the identities exchanged during a phase 2 Security Association (SA) negotiation were not IP-type addresses.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to ensure that phase 2 IDs are IP-type addresses.

Module

oakley_phaseII.cpp, policy.cpp

Procedure name

None.

EZD0937I

Could not add certificate with label (*label*) to the supported certificate authority list

Explanation

The IKE server could not find a certificate with the specified label on the key ring identified by the Key ring setting for the z/OS Image. This label was defined to be in the specified Key Ring database. In the IKE daemon configuration file, this label corresponds to the SupportedCertAuth parameter of the IkeConfig statement.

label is the label of this certificate.

System action

The IKE server will ignore the label; IKE daemon processing continues.

Operator response

Verify that the label is correct.

When configured without the IBM Configuration Assistant for z/OS Communications Server:

- Verify that the label specified on the SupportedCertAuth parameter of the IkeConfig statement is correct.
- Verify that the key ring identified by the KeyRing parameter of the IkeConfig statement is correct.

See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IkeConfig statement.

When configured with the IBM Configuration Assistant for z/OS Communications Server:

- Verify that a certificate with that label is connected to the key ring identified by the Key ring database configured on the IPSec: IKE Daemon Settings panel.

- Verify that the key ring database name and location are configured correctly.

See the online helps in the GUI for additional information.

System programmer response

None.

Module

cacache.cpp

Procedure name

None.

EZD0938I **Unsupported algorithm (*algorithm*) found in transform**

Explanation

The IKE negotiation failed because the algorithm specified in a transform is not supported.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

algorithm

The numerical value of the unsupported algorithm. Supported algorithms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 algorithms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement. Go to the <http://www.iana.org/assignments/isakmp-registry> website for additional information about algorithm number assignments.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to ensure that all hash, encryption, and authentication algorithms are specified correctly for all transforms.

Module

ipsecklen.cpp, oakley_mf.cpp

Procedure name

None.

EZD0939I **Bad proposal layout for protocol (*protocol_id*)**

Explanation

An IKE negotiation failed because the proposal layout for the specified protocol is not valid. Possible reasons for the error are too many suites in an offer or a proposal that is too long or too short.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

protocol_id is the ID of the protocol.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a proposal that was not valid and ask the administrator to ensure that their policy is configured correctly.

Module

policy.cpp

Procedure name

None.

EZD0940I	Wrong security parameter index(SPI) size (<i>SPI_size_exp</i> / <i>SPI_size</i>) for protocol (<i>protocol_id</i>) in proposal (<i>proposal</i>)
-----------------	---

Explanation

An IKE message failed to be processed because an SPI size was not valid.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

SPI_size_exp is the expected SPI size.

SPI_size is the SPI size found.

protocol_id is the protocol ID.

proposal is the proposal number or -1 if this message was not part of an SA negotiation.

System action

Contact the system programmer.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a proposal that was not valid and ask the administrator to ensure that their policy is configured correctly.

Module

doi.cpp, infoXchg.cpp, policy.cpp

Procedure name

None.

EZD0941I **More than 1 *object* in proposal reply for protocol (*protocol_id*)**

Explanation

An IKE negotiation failed because more than one transform was specified in a reply or more than one proposal was chosen on a match of an offered proposal.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

object is either **suite** or **transform**. If *object* is **suite**, then more than one proposal was chosen by the remote security endpoint. If *object* is **transform**, then more than one transform was specified for a proposal.

protocol_id is the protocol ID.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to ensure that only one proposal is accepted from an offer and only one transform is specified in a proposal.

Module

policy.cpp

Procedure name

None.

EZD0942I **Duplicate protocol (*protocol*) found in proposal (*proposal_num*)**

Explanation

An IKE daemon negotiation failed because the reply proposal contains more than one transform with the specified protocol.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

protocol is the protocol ID.

proposal_num is the proposal number.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to ensure that they do not specify the same protocol more than once in a single proposal.

Module

policy.cpp

Procedure name

None.

EZD0943I **Proposal (*proposal_num*) contains too few bytes (*bytes*)**

Explanation

An IKE negotiation failed because the proposal does not contain enough data.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

proposal_num is the proposal number.

bytes is the number of bytes missing from the proposal.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a proposal that was not valid and ask the administrator to ensure that their policy is configured correctly.

Module

policy.cpp

Procedure name

None.

EZD0944I **Transform *transform_id* : duplicate attribute (*attribute*)**

Explanation

An IKE negotiation failed because a transform specified the same attribute more than the allowed number of times.

Additional diagnostic messages with the same message instance number will be issued to identify the impacted security association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

attribute is the attribute that was duplicated. See the information about [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about transform attributes.

System action

This SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to ensure that all attributes are specified correctly. With the exception of the life-value tag, attributes can be specified only once in a single transform.

Module

gen.cpp

Procedure name

None.

EZD0945I**No proposal specified or proposal is empty**

Explanation

An IKE negotiation failed because a proposal does not exist or contains no data.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a proposal that was not valid and ask the administrator to ensure that their policy is configured correctly.

Module

policy.cpp

Procedure name

None.

EZD0946I

**Protocol mismatch : IpDataOffer (*offer_num*) requires (*reqd_proto*)
but proposal (*prop_num*) includes (*prop_proto*)**

Explanation

An IKE phase 2 negotiation encountered a protocol mismatch.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

offer_num is the number of an IpDataOffer referenced from an IpDynVpnAction. The number corresponds to the order of the references in the IpDynVpnAction. Therefore, the first IpDynVpnOffer referenced from the IpDynVpnAction would have number 1 in this message.

reqd_proto is the description of the protocols configured in the IpDataOffer indicated by the *offer_num* value. Possible values include **AH**, **ESP**, or **AH+ESP**. **AH+ESP** indicates that the combination of AH and ESP are required.

prop_num is the proposal number from the remote security endpoint.

prop_proto is the description of the protocols proposed in the proposal indicated by *prop_num*. Possible values include **AH**, **ESP**, or **AH+ESP**. **AH+ESP** indicates that the combination of AH and ESP was proposed.

System action

The IKE negotiation might succeed if a different proposal is found and accepted. If an acceptable proposal is not found, the IKE negotiation fails. If the negotiation fails, message EZD1022I will be issued, which will identify the IpDynVpnAction that referenced the IpDataOffer indicated by the *offer_num* value. IKE daemon processing continues.

Operator response

If the proposal that contains the mismatch is the one that should be accepted, take one of the following actions:

- Alter the local policy to accept the protocols in this proposal.
- Contact the system programmer.

System programmer response

If the proposal that contains the mismatch is the one that should be accepted, notify the administrator of the remote security endpoint that you received a protocol mismatch and ask the administrator to ensure that they alter the remote configuration to propose the correct protocols.

Module

policy.cpp

Procedure name

None.

EZD0948I

IKE DETECTED MODIFY COMMAND ERROR : *error*

Explanation

While processing a MODIFY command, the IKE daemon received an error.

error is the error that was detected. Possible values are:

NO VERB

Indicates a required verb parameter was not specified on the MODIFY command.

TOO LONG

Indicates that the MODIFY command syntax was too long.

ZERO LENGTH

Indicates that the MODIFY command was missing required parameters.

INVALID COMMAND

Indicates that a verb that was not valid was used on the MODIFY command.

System action

The command is ignored; IKE daemon processing continues.

Operator response

Check the command syntax, and try the request again. If the command was too long, try using abbreviations where possible.

System programmer response

None.

Module

mdfysrvr.cpp

Procedure name

None.

EZD0950I**IKE CANNOT RETRIEVE MODIFY COMMAND DATA**

Explanation

The Internet Key Exchange (IKE) daemon encountered an error while attempting to retrieve MODIFY command data from the communications area.

System action

The IKE daemon was unable to process the MODIFY command.

Operator response

Try the request again. If the failure persists, look for other OS messages about the failure.

System programmer response

None.

Module

mdfysrvr.c

Procedure name

None.

EZD0951I**No proposal data to lay out**

Explanation

An IKE negotiation failed because the IKE daemon found no valid proposals.

System action

The Security Association (SA) negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received an empty proposal and ask the administrator to ensure that their policy is configured correctly.

Module

layout.cpp

Procedure name

None.

EZD0952I**Error on ioctl call (*ioctl*) : *errno* | *errnojr* | *errortext***

Explanation

The system was unable to successfully perform the specified ioctl call.

ioctl is the ioctl call that was called.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

errortext provides further information about why the ioctl call that was called failed or it describes the meaning of *errno*.

System action

The operation being performed failed; IKE daemon processing continues.

Operator response

Verify that the system stacks are started and operating correctly and reissue the command. If the error persists, contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

isakmp_base_sa.cpp, simple_net.cpp, stackobj.cpp

Procedure name

None.

EZD0953I **Filter installation failed due to conflict with existing filter**

Explanation

An IKE negotiation failed because the IKE daemon was unable to install a dynamic filter in the TCP/IP stack due to a conflict with an existing filter. This error occurs whenever an existing dynamic filter overlaps the new filter partially, or whenever an existing filter exactly matches the new filter. Because of the conflict, the stack cannot determine which filter should take precedence, so the new filter is rejected.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Change the properties of the tunnel so that the dynamic filter does not conflict with an existing dynamic filter, and restart the negotiation. If the error persists, contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

stackobj.cpp

Procedure name

None.

EZD0954I **Transform *transform_id* : no encryption algorithm specified**

Explanation

An IKE negotiation failed because the specified transform does not specify an encryption algorithm.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration](#)

Reference. Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to ensure that an encryption algorithm is specified for each transform.

Module

gen.cpp, oakley_lf.cpp

Procedure name

None.

EZD0956I	Transform <i>transform_id</i> : no Diffie-Hellman group identifier specified
-----------------	---

Explanation

An IKE negotiation failed because the specified transform did not specify a Diffie-Hellman (DH) group identifier.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to verify that they have a DH group specified for each transform.

Module

oakley_lf.cpp

Procedure name

None.

EZD0957I**Phase 1 Security Association *p1_said* created successfully but an error at the coupling facility makes it unavailable for takeover**

Explanation

The indicated Security Association (SA) was created and is fully functional. However, when the phase 1 information was passed into the coupling facility, an error occurred. This phase 1 SA is not available for takeover.

p1_said is the ID of the specified SA.

System action

The SA is not available for takeover; IKE daemon processing continues.

Operator response

See the information about [Sysplex-wide Security Associations in z/OS Communications Server: IP Diagnosis Guide](#) for information about correcting the problem at the coupling facility. After correcting the problem at the coupling facility, you can manually refresh the SA using the **ipsec** command to make it available for takeover. See the information about the [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options. Alternatively, you can wait for the SA to be refreshed automatically according to the configured lifetime or lifesize settings.

System programmer response

None.

Module

phase1.cpp

Procedure name

None.

EZD0958I**Unsupported protocol (*protocol_id*) for phase *phase* Security Association negotiation**

Explanation

An IKE negotiation failed because the server encountered a protocol that is not valid in the current Security Association (SA) negotiation phase. Phase 1 negotiation supports only the IKE protocol and phase 2 supports only the ESP and AH protocols.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

protocol_id is the numerical value that identifies the unsupported protocol.

phase is the phase (1 or 2) that the negotiation was in when the error occurred.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to verify that they are using only the supported protocols for SA negotiations that are listed in **Explanation** above.

Module

doi.cpp, policy.cpp

Procedure name

None.

EZD0959I	Proposal (<i>proposal</i>) using protocol (<i>protocol_id</i>) is out of order - last proposal was <i>last_proposal</i>
-----------------	--

Explanation

An IKE negotiation failed because the current proposal number is out of order. Proposals must be processed in monotonically increasing order.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

proposal is the proposal number.

protocol_id is the protocol ID.

last_proposal is the number of the last proposal.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a proposal out of order and ask the administrator to ensure that their proposal configuration is correct.

Module

policy.cpp

Procedure name

None.

EZD0960I	Phase 1 proposal contains non-IKE protocol
-----------------	---

Explanation

An IKE negotiation failed because the current phase 1 proposal contains a non-IKE protocol. During phase 1, the only protocol allowed is IKE.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a phase 1 message with a non-IKE protocol specified and to verify that their proposal configuration is correct.

Module

policy.cpp

Procedure name

None.

EZD0961I	Proposal contains <i>number</i> extra bytes
-----------------	--

Explanation

An IKE negotiation failed because the current proposal contains extra data.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

number is the number of extra bytes that the proposal contains.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a proposal that was not valid and ask the administrator to ensure that their policy is configured correctly.

Module

policy.cpp

Procedure name

None.

EZD0962I	Responder mode in phase 1 policy does not match initiator mode (<i>mode</i>)
-----------------	---

Explanation

The IKE negotiation failed because the mode specified for the responder in the policy database is not compatible with the role specified by the initiator of the Security Association (SA) negotiation.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

mode is the mode that this negotiation requires. *mode* is either **main** or **aggressive**.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

When configured without the IBM Configuration Assistant for z/OS Communications Server, check the `HowToRespond` parameter in the `KeyExchangeAction` statement corresponding to this phase I negotiation. If the mode reported in *mode* should be allowed, change the `HowToRespond` parameter to allow *mode*. Otherwise, notify the administrator of the remote security endpoint that your policy does not allow this mode of negotiation. See the information about the Policy Agent and [policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

When configured with the IBM Configuration Assistant for z/OS Communications Server, edit the corresponding Connectivity Rule in the TCP/IP stack and check the Responder Mode setting on the Advanced IPsec: Dynamic Tunnels: Key Exchange Settings panel. If the mode reported in *mode* should be allowed, change the Responder Mode setting to allow *mode*. Otherwise, notify the administrator of the remote security endpoint that your policy does not allow this mode of negotiation. See the online helps in the GUI for additional information.

System programmer response

None.

Module

policy.cpp

Procedure name

None.

EZD0963I **INTERNAL ERROR *errid* - UNABLE TO OBTAIN MEMORY OF SIZE *size***

Explanation

The Internet Key Exchange (IKE) daemon was unable to obtain the required amount of memory storage.

errid is a unique ID for this error.

size is the amount of storage the server attempted to obtain.

System action

Results are unpredictable.

Operator response

Ensure that there is enough memory available on the system and try the operation again.

System programmer response

None.

Module

Numerous

Procedure name

None.

EZD0964I	IKE CANNOT KILL MAIN THREAD : errno errnojr description
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon received a STOP command but was unable to kill the main thread. The most likely reason is that the MAIN thread no longer exists.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

description describes the meaning of *errno*.

System action

The command failed.

Operator response

None.

System programmer response

None.

Module

mdfysrvr.c

Procedure name

None.

EZD0965I	Validity check or authentication failure occurred using a shared key
-----------------	---

Explanation

A validity check failure or authentication failure occurred on a message for a phase 1 Security Association configured for shared key authentication. This indicates a likely mismatch between the locally configured shared key value and the shared key value configured on the remote security endpoint.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA) including the applicable KeyExchangeRule statement. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Confirm that the configured shared Key value matches the value configured on the remote security endpoint.

When configured without the IBM Configuration Assistant for z/OS Communications Server, confirm that the SharedKey value on the applicable KeyExchangeRule statement matches the key value that is configured on the remote security endpoint. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about the KeyExchangeRule statement and the SharedKey parameter.

When configured with the IBM Configuration Assistant for z/OS Communications Server, confirm that the Shared Key value on the applicable Connectivity Rule matches the key value that is configured on the remote security endpoint. See the online helps in the GUI for additional information.

System programmer response

None.

Module

oakley_kep.cpp

Procedure name

None.

EZD0966I**IKE CANNOT INITIALIZE MODIFY COMMAND QUEUE**

Explanation

The Internet Key Exchange (IKE) daemon was unable to initialize the MODIFY command queue.

System action

The MODIFY command service is not available; IKE daemon processing continues.

Operator response

If you require the MODIFY command service, restart the IKE daemon. If the problem persists, contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

mdfysrvr.c

Procedure name

None.

EZD0967I**IKE RELEASE *ver.rel.mod* SERVICE LEVEL *level* CREATED ON *date***

Explanation

This message is issued when the IKE daemon is started.
ver.rel.mod is the z/OS version, release, and modification level.
level is the service level of the IKE daemon.
date is the date this version of the IKE daemon was created.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

fw_initterm.c

Procedure name

None.

EZD0968I	Unknown or incorrect address type (<i>address_type</i>) in Security Association address
-----------------	--

Explanation

The specified address type in the SA is unsupported.
Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.
In the message text:
address_type
The number of the unsupported address type

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Request that the administrator of the remote security endpoint check their policy and ensure that only supported addresses are being used.

Module

sa_addr.cpp

Procedure name

None.

EZD0969I

**Proposal too short or security parameter index (SPI) size too large
(*reason*)**

Explanation

An IKE negotiation failed because the proposal does not contain enough data or the SPI size in the transform is too large.

Additional diagnostic messages with the same message instance number will be issued identifying the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

reason indicates which parameter was incorrect. *reason* is either **spi** or **proposal**.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a payload that was not valid and ask the administrator to ensure that their policy is configured correctly.

Module

policy.cpp

Procedure name

None.

EZD0970I

**C/C++ runtime library function call *function* failure : *errid* - *errno* |
errnojr | *description***

Explanation

A C/C++ run-time library function call returned an error. This error should not occur during normal processing.

function is the function call that failed. See the [z/OS C/C++ Runtime Library Reference](#) for more information.

errid is a unique ID for this error.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

description describes the meaning of *errno*.

System action

The operation being performed failed; IKE daemon processing continues.

Operator response

Correct the error indicated by *errno*, *errnojr*, and *description* and restart the IKE daemon if necessary.

System programmer response

None.

Module

cp_convert.c, fw_initterm.c, fwmsgq.c, main.cpp, sa.cpp, simple_net.cpp, simple_timer.cpp, simple_ureq.cpp, stackmgr.cpp, stckobj.cpp, syslogc.c, verifyq.cpp

Procedure name

EZD0971I	Trying to use phase 2 Security Association but phase 1 key exchange is not complete
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon attempted to send a notification with a phase 2 security association (SA), but the phase 1 key exchange is not complete.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The message cannot be sent until the phase 1 key exchange is complete; the IKE daemon continues.

Operator response

None.

System programmer response

None.

Module

doi.cpp

Procedure name

None.

EZD0973I	Responder-Lifetime notification payload received for <i>phase</i> security association and is ignored
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon received a Responder-Lifetime notification message. The Internet Key Exchange (IKE) daemon ignores Responder-Lifetime notification messages and maintains the original lifetime value.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

phase is either **1** for an IKE Security Association or **2** for a dynamic Security Association.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

doi.cpp, oakley_phaseII.cpp

Procedure name

None.

EZD0974I	Attribute length (<i>attribute_length</i>) is not valid - expected (<i>valid_length</i>)
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon received a notification message with an incorrect attribute length.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

attribute_length is the length that was received.

valid_length is the length that was expected.

System action

The message request failed; IKE daemon processing continues.

Operator response

Notification messages are not critical to IKE operation, but if this message is seen repeatedly, notify the administrator of the remote security endpoint that you are receiving messages that are not valid.

System programmer response

None.

Module

doi.cpp

Procedure name

None.

EZD0975I**Unknown message type (*message_type*)**

Explanation

The Internet Key Exchange (IKE) daemon received a message type that is not supported.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

message_type is the number of the message type received.

System action

The message cannot be processed; IKE daemon processing continues.

Operator response

None. However if this message is seen often, contact the system programmer.

System programmer response

None. However if this message is seen often, notify the administrator of the remote security endpoint that you are receiving messages that are not valid.

Module

doi.cpp

Procedure name

None.

EZD0977I**IKE CANNOT START BECAUSE IT IS ALREADY RUNNING**

Explanation

There can be only one active Internet Key Exchange (IKE) daemon. A second IKE daemon cannot be started when one is already running.

System action

The IKE daemon that attempted to start ends; the running IKE daemon continues.

Operator response

Use the STOP command to stop the active IKE daemon and try the request again.

System programmer response

None.

Module

fw_initterm.c

Procedure name

None.

EZD0978I**Initiator must specify exchange type**

Explanation

An IKE negotiation failed because the initiator of the negotiation did not specify an exchange type. The initiator must specify whether to use main or aggressive mode.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the remote security endpoint that you received a request to start a negotiation, but the exchange type was not specified.

Module

policy.cpp

Procedure name

None.

EZD0979I**Refresh of phase 1 Security Association *p1_SA_ID* could not be performed**

Explanation

The Internet Key Exchange (IKE) daemon could not refresh the specified phase 1 Security Association (SA) because the IKE message queue could not be accessed.

Additional diagnostic messages that have the same message instance value will be issued to further identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

p1_SA_ID is the phase 1 SA ID of this SA.

System action

The SA is not refreshed; IKE daemon processing continues.

Operator response

No action is required, but the SA will expire after the normal lifetime or life-size has been exceeded. To refresh the SA manually, use the **ipsec -k refresh** command.

See the information about the [managing network security information in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

System programmer response

None.

Module

isakmp_base_sa.cpp

Procedure name

None.

EZD0980I	No transform specified in Key Exchange Protocol initialization
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon received a message to start a Key Exchange Protocol (KEP) but no transform was specified.

System action

The request failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to verify that their policy is configured correctly.

Module

genkep.cpp

Procedure name

None.

EZD0981I	Unable to set ID - ID mismatch
-----------------	---------------------------------------

Explanation

The Internet Key Exchange (IKE) daemon could not set the ID of a security endpoint because the data did not match what was expected. This might occur when initiating a phase 1 security association (SA) negotiation and the responder used a different identity than was expected based on local configuration.

Additional diagnostic messages that have the same message instance number will be issued to further identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The request failed; IKE daemon processing continues.

Operator response

Verify that the LocalSecurityEndpoint and RemoteSecurityEndpoint statements have valid identity strings and are defined correctly. Review the configuration of the IKE peer to confirm that it uses the same identity as is locally configured.

System programmer response

None.

Module

doi.cpp

Procedure name

None.

EZD0982I	Payload length error
-----------------	-----------------------------

Explanation

The Internet Key Exchange (IKE) daemon encountered a payload that was not the correct size.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The request failed and the SA negotiation might fail; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a payload that was not valid and ask the administrator to ensure that their policy is configured correctly.

Module

isakmp_base_sa.cpp, oakley_kep.cpp, pksig.cpp, simple_ureq.cpp

Procedure name

None.

EZD0983I	Unknown request type (<i>request_id</i>)
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon received a request to perform an unknown action.

request_id is the number that identifies the request.

System action

The request failed; IKE daemon processing continues.

Operator response

Ensure that the request entered is valid and try the operation again.

System programmer response

None.

Module

anchor_ureq.cpp, simple_ureq.cpp

Procedure name

None.

EZD0984I	IKE function <i>locid</i> - function failed : <i>val1</i> <i>val2</i> <i>val3</i>
-----------------	--

Explanation

An IKE function did not complete successfully because of an error condition in the function specified.

Additional diagnostic messages that have the same message instance number will be issued to further identify the error. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

locid identifies the location of this error.

function is the IKE function that did not complete successfully.

val1 is internal error information or 0 if not available.

val2 is internal error information or 0 if not available.

val3 is internal error information or blank if not available.

System action

The specified function failed; IKE daemon processing continues.

Operator response

Look for other messages that have the same message instance number and follow the instructions documented in those messages. Because these messages are usually the result of other errors that are being encountered, they can be turned off by not setting the VERBOSE bit in the IkeSyslogLevel parameter on the IkeConfig statement. See the information about the [IKE daemon in z/OS Communications Server: IP Configuration Reference](#) for more information about the IkeConfig statement and IKE daemon configuration file.

System programmer response

None.

Module

various

Procedure name

None.

EZD0985I	No proposal chosen
-----------------	---------------------------

Explanation

An IKE negotiation failed because no proposal in the offer was accepted by the local security endpoint.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Change the local policy configuration or ask the remote security end point administrator to change their policy so that a proposal can be accepted.

When configured without the IBM Configuration Assistant for z/OS Communications Server, see the information about the Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

When configured with the IBM Configuration Assistant for z/OS Communications Server, see the online helps in the GUI for additional information.

System programmer response

None.

Module

policy.cpp

Procedure name

None.

EZD0986I**IKE IS NOT APF AUTHORIZED**

Explanation

An attempt was made to start the Internet Key Exchange (IKE) daemon application, but the application is not APF authorized. APF authorization is required to execute the IKE daemon.

System action

The IKE daemon ends.

Operator response

Contact the system programmer.

System programmer response

Ensure that the IKE daemon resides in an APF-authorized library.

Module

fw_initterm.c

Procedure name

None.

EZD0987I

Certificate payload or request received but certificates are not supported

Explanation

The Internet Key Exchange (IKE) daemon encountered a certificate payload or a certificate request in a message, but the server is not configured to support certificates.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The certificate cannot be used and the negotiation will probably fail; the IKE daemon continues.

Operator response

If you want RSA signature authentication, verify that the Key ring name setting is correct. Otherwise, ensure that the remote security endpoint administrator uses the shared key method of authentication.

When configured without the IBM Configuration Assistant for z/OS Communications Server, the Key ring database setting is specified on the IkeConfig statement with the KeyRing parameter. See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IkeConfig statement.

When configured with the IBM Configuration Assistant for z/OS Communications Server, the Key ring database name is configured on the IPSec: IKE Daemon Settings panel. See the online helps in the GUI for additional information.

System programmer response

None.

Module

oakley_kep.cpp

Procedure name

None.

EZD0988I

Rcookie is zero - message ID is non-zero

Explanation

During an IKE message exchange, the IKE daemon received a message that had an Rcookie with a value of 0, but the message ID was nonzero. A nonzero message ID indicates a phase 2 negotiation, in which case the Rcookie is required to be nonzero.

System action

The message was not processed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about the error and ask the administrator to ensure that their policy is configured correctly.

Module

anchor_msg.cpp

Procedure name

None.

EZD0989I	Transform <i>transform_id</i> : Diffie-Hellman group (<i>DH_group</i>) is not supported
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon detected a Diffie-Hellman (DH) group that is not supported. Only groups 1, 2, 5, and 14 are supported.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

DH_group is the ID of the unsupported DH group. DH groups are specified on the DHGroup parameter on a KeyExchangeOffer Statement.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about the error and ensure that their DH group identifiers are specified correctly.

Module

gen.cpp

Procedure name

None.

EZD0990I	The IKE daemon is set up to support RSA signature mode of authentication for stack <i>stackname</i> using the local keyring
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon successfully accessed the SAF key ring to support the RSA signature mode of authentication. This key ring was specified by the KeyRing parameter of the IkeConfig statement.

In the message text:

stackname

The name of the stack for which RSA signature mode of authentication is available.

System action

The IKE daemon will support RSA signature mode of authentication for the stack indicated by the *stackname* value; the IKE daemon continues.

Operator response

None.

System programmer response

None.

User response

Not applicable.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

cert_mgr.cpp

Routing code

10

Descriptor code

12

Example

EZD0990I The IKE daemon is set up to support RSA signature mode of authentication for stack TCPCS using the local keyring

EZD0991I Transform *transform_id* : unsupported authentication type (*auth_type*)
for phase 1 Security Association

Explanation

An IKE phase 1 Security Association (SA) negotiation failed because the authentication type is not supported.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration](#)

Reference. Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement.

auth_type is the number of the unsupported authentication type. The valid authentication types are PreshareKey and RsaSignature, which are specified on the HowToAuthPeers parameter of an KeyExchangeOffer statement.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to ensure that only pre-shared keys or RSA signature is being used for peer authentication.

Module

gen.cpp

Procedure name

None.

EZD0992I	IKE daemon running swappable : <i>errno</i> <i>errno</i> (<i>description</i>) <i>errnojr</i>
-----------------	---

Explanation

An error occurred when the IKE daemon attempted to set itself as non-swappable.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description describes the meaning of *errno*.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

IKE daemon processing continues as a swappable process.

Operator response

None.

System programmer response

Running the process as swappable might affect the IKE daemon performance. Correct the problem, if possible, and restart the IKE daemon.

Module

main.cpp

Procedure name

None.

EZD0993I**Transform *transform_id* : Unable to layout *protocol* transform header**

Explanation

An IKE negotiation failed because the server cannot build the transform header for the specified protocol. This error is due to either the transform header being empty or a memory allocation failure.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

transform_id is the value used to identify this transform in an IKE proposal. Supported transforms for IKE SAs are described in [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#). Phase 1 transforms are specified on a KeyExchangeOffer statement, and phase 2 transforms are specified on an IpDataOffer statement. Phase 2 transforms specify the encapsulation mode on the HowToExcap statement.

protocol is a string representing the protocol. *protocol* is either **AH**, **ESP**, or **OAKLEY**.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

If the error was due to a memory allocation failure, fix the error and try again. Otherwise, contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

ah_lf.cpp, esp_lf.cpp, oakley_lf.cpp

Procedure name

None.

EZD0994I**Unable to initialize anchor**

Explanation

During initialization, the IKE daemon was unable to initialize the anchor that is the main IKE control object.

Additional diagnostic messages that have the same message instance number will be issued to identify the error. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The IKE daemon ends.

Operator response

See the **User or Operator response** in the other messages that have the same message instance number to correct the error.

System programmer response

None.

Module

main.cpp

Procedure name

None.

EZD0995I **Phase 1 Security Association *sa_id* is expired**

Explanation

The Internet Key Exchange (IKE) daemon detected a request to access a phase 1 Security Association (SA) that has expired.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

sa_id is the phase 1 SA ID.

System action

The request failed; IKE daemon processing continues.

Operator response

To satisfy the request, the SA must be refreshed or re-started. Use the **ipsec -k refresh** or **ipsec -k activate** command to refresh or activate a phase 1 SA. See the information about the [managing network security](#) in *z/OS Communications Server: IP System Administrator's Commands* or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

System programmer response

None.

Module

oakley_kep.cpp, sa.cpp

Procedure name

None.

EZD0996I **Unsupported payload type (*type*)**

Explanation

The Internet Key Exchange (IKE) daemon detected a payload of an unsupported type.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

type is the numerical representation of the unsupported payload type.

System action

The request failed because the message was not processed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received an unsupported payload type and ask the administrator to ensure that their policy is configured correctly.

Module

msg.cpp, oakley_kep.cpp

Procedure name

None.

EZD0998I**Unable to authenticate IKE message**

Explanation

An IKE request or negotiation failed because the hash verification of the message failed.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The IKE request or SA negotiation failed; IKE daemon processing continues.

Operator response

Try the operation again. If errors continue, contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you are receiving messages that you are unable to authenticate and ask the administrator to ensure that they are using a valid hash algorithm.

Module

oakley_kep.cpp

Procedure name

None.

Chapter 11. EZD1xxxx messages

EZD1005I

Too many life attributes specified

Explanation

The Internet Key Exchange (IKE) daemon received a request to modify the life of a security association (SA) and detected an attribute list that contains too many attributes. Valid attributes are LIFE-TYPE and LIFE SIZE.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The request failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received this message and ask the administrator to verify that their policy is configured correctly.

Module

oakley_kep.cpp

Procedure name

None.

EZD1006I

No relevant payload was received

Explanation

The Internet Key Exchange (IKE) daemon detected a message that does not contain a payload required to handle the current request.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted security association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The request failed and the SA negotiation might fail; IKE daemon processing continues.

Operator response

If the SA negotiation fails, notify the administrator of the remote security endpoint that you received a payload containing no relevant information.

System programmer response

None.

Module

oakley_kep.cpp, phase1.cpp

Procedure name

None.

EZD1007I**Received message is not encrypted**

Explanation

The Internet Key Exchange (IKE) daemon detected a message that was not encrypted but should have been. Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The request failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a message that should have been encrypted but was not and ask the administrator to ensure that their policy is configured correctly.

Module

oakley_kep.cpp

Procedure name

None.

EZD1008I***errid System SSL CMS call function failure : gsk_rc description***

Explanation

A call to the System SSL Certificate Management Services (CMS) API returned an error. This error should not occur during normal processing.

errid is the unique ID for this error.

function is the API call that failed. The System SSL CMS API is documented in [z/OS Cryptographic Services System SSL Programming](#).

gsk_rc is the hexadecimal CMS status code. See the information about the [CMS status codes \(03353xxx\)](#) in [z/OS Cryptographic Services System SSL Programming](#).

description describes the meaning of *gsk_rc*.

System action

The operation being performed fails; IKE daemon processing continues.

Operator response

Use `gsk_rc` and the description provided to fix the error.

System programmer response

None.

Module

`asn_utils.cpp`, `cacache.cpp`, `cert_rep.cpp`, `certcache.cpp`, `pki390.cpp`, `key_agree.c`

Procedure name

None.

EZD1009I

Received message is a replay message

Explanation

The Internet Key Exchange (IKE) daemon detected a message that was already processed.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The message is not processed; IKE daemon processing continues.

Operator response

Replays are not errors and can be caused by lost packets, network congestion. Usually, no action is required. If there are a large number of replays, notify the administrator of the remote security endpoint that you are receiving a large number of replays.

System programmer response

None.

Module

`oakley_kep.cpp`, `oakley_phaseII.cpp`, `phase1.cpp`

Procedure name

None.

EZD1010I

IKE message exchange is in unknown state (*state*) for *mode* phase *phase* Security Association

Explanation

The Internet Key Exchange (IKE) daemon detected a message that cannot be processed for a security association (SA) in the current state.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

state is the current state of the SA negotiation. *state* is either **unknown** or **wait for key exchange**.

mode is the mode in which the daemon is acting. *mode* is either **initiator** or **responder**.

phase is the phase of this SA. *phase* is either **1** or **2**.

System action

The message cannot be processed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you are receiving messages that are not valid for the *state* and *mode* that is current for this SA negotiation and ask the administrator to ensure that their policy is configured correctly.

Module

oakley_phaseII.cpp, phase1.cpp

Procedure name

None.

EZD1011I**Duplicate phase 2 *payload* payload encountered**

Explanation

The Internet Key Exchange (IKE) daemon detected a payload that was already received or received more payloads of this type than expected.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

payload is the type of duplicate payload. *payload* can be one of the following:

- **Key Exchange**
- **ID**
- **NONCE**

System action

The message was not processed; IKE daemon processing continues.

Operator response

If a large number of these messages are issued, notify the administrator of the remote security endpoint that you are receiving duplicate messages.

System programmer response

None.

Module

oakley_phaseII.cpp

Procedure name

None.

EZD1012I**Unexpected payload type (*payload*)**

Explanation

The Internet Key Exchange (IKE) daemon detected a payload type that is not supported or not expected in the current stage of processing.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

payload is the type of payload found. *payload* is one of the following:

- **Key Exchange**
- **ID**
- **NONCE**
- **other**

System action

The message was not processed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received an unexpected payload type and ask the administrator to ensure that their policy is configured correctly.

Module

oakley_phaseII.cpp

Procedure name

None.

EZD1013I**Unexpected phase 2 message - not a replay**

Explanation

The Internet Key Exchange (IKE) daemon received a message during phase 2 processing that was not expected and was not a replay message.

System action

The message is ignored; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you are receiving unexpected phase 2 messages during this Security Association negotiation and ask the administrator to verify that their policy is configured correctly.

Module

oakley_phaseII.cpp

Procedure name

None.

EZD1014I	No <i>payload</i> payload received
-----------------	---

Explanation

During an IKE message exchange, the IKE daemon received a message indicating that a payload of the specified type should have already been processed, but the payload had not been received in any previous message.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

payload is the type of payload received. *payload* can be one of the following:

- **NONCE**
- **ID**
- **Key Exchange**
- **Common**

System action

The message is not processed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you did not receive the payload mentioned above and ask the administrator to verify that their policy is configured correctly.

Module

oakley_phaseII.cpp, phase1.cpp, sa.cpp

Procedure name

None.

EZD1015I	Unknown <i>object</i> (<i>value</i>)
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon encountered an object that is not supported.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

object is the type of object being operated on. *object* can be one of the following:

- **DOI**
- **notify type**
- **transform**
- **authAlg**

value is the numerical representation of the object value.

System action

If object is **DOI** or **notify type**, the notification was not processed. Otherwise, the SA negotiation failed. IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you are receiving data that is not valid in IKE messages and ask the administrator to ensure that their policy is configured correctly.

Module

infoXchg.cpp, oakley_phaseII.cpp

Procedure name

None.

EZD1018I	Could not resolve hostname for InitiateToLocation (<i>hostname</i>)
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon failed to resolve the specified host name.

hostname is the host name that could not be resolved.

System action

The request failed; IKE daemon processing continues.

Operator response

Verify that the host name is correct and that your domain name server is working correctly.

When configured without the IBM Configuration Assistant for z/OS Communications Server, the host name setting is configured on the InitiateToLocation parameter of a LocalStartAction statement. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about the InitiateToLocation parameter.

When configured with the IBM Configuration Assistant for z/OS Communications Server, to verify that the host name setting is correct, edit the corresponding Connectivity Rule in the GUI. For Host to Gateway or Gateway to Gateway topologies, this setting is found on the Remote Security End Point panel. For Host to Host or Gateway to

Host, this setting is found on the Advanced IPsec: Dynamic Tunnels: Local Activation panel. See the online helps in the GUI for additional information.

System programmer response

None.

Module

policymgr.cpp

Procedure name

None.

EZD1019I	Could not open certificate repository (<i>name</i>) (<i>description</i>) (<i>gsk_rc</i>)
----------	--

Explanation

The Internet Key Exchange (IKE) daemon was unable to open the certificate repository identified by the key ring database setting.

name is the name of the certificate repository (key ring database) that IKE was unable to open.

description describes the meaning of *gsk_rc*.

gsk_rc is the hexadecimal Certificate Management Services (CMS) status code. See the information about the CMS status codes (03353xxx) in z/OS Cryptographic Services System SSL Programming.

System action

The IKE daemon will not support RSA signature mode authentication; IKE daemon processing continues.

Operator response

Ensure that the repository name is defined correctly and that the user under which the IKE daemon was started is authorized to access the repository.

When configured without the IBM Configuration Assistant for z/OS Communications Server, the certificate repository name is set on the KeyRing parameter of the IkeConfig statement. See the information about the [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information.

When configured with the IBM Configuration Assistant for z/OS Communications Server, the certificate repository name is set in the key ring database name located in the IPsec: IKE Daemon Settings panel.

System programmer response

None.

Module

cert_rep.cpp

Procedure name

None.

EZD1020I	Incorrect payload size (<i>payload length / length-expected</i>)
----------	--

Explanation

The Internet Key Exchange (IKE) daemon detected a payload that is not the correct size for the expected payload type.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

payload_length is the length of the payload received.

length-expected is the length the payload should have been.

System action

The request failed; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that you received a payload with an incorrect size and ask the administrator to verify that their policy is configured correctly.

Module

msg.cpp, oakley_phaseII.cpp

Procedure name

None.

EZD1021I	No proposal chosen with KeyExchangeRule (<i>rule</i>) and KeyExchangeAction (<i>action</i>)
-----------------	--

Explanation

An IKE phase 1 negotiation failed because no proposal in the offer was accepted by the local security endpoint.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

rule is the rule name.

- In the policy agent configuration file, *rule* is the name of a KeyExchangeRule statement in the policy agent configuration.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, *rule* corresponds to the name of a Connectivity Rule. *rule* also contains a suffix appended to the Connectivity Rule name to guarantee uniqueness.

action is the action name.

- In the policy agent configuration file, *action* is the name of a KeyExchangeAction statement in the policy agent configuration file.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, *action* corresponds to the name of a Connectivity Rule. The rule name also contains a numeric suffix appended to the Connectivity Rule name to guarantee uniqueness.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

This message will be accompanied by one or more EZD1093I messages. See the **User or Operator Response** in [EZD1093I](#) for information about resolving this negotiation failure.

System programmer response

None.

Module

policy.cpp

Procedure name

None.

EZD1022I	No proposal chosen with IpFilterRule (<i>rule</i>) and IpDynVpnAction (<i>action</i>)
-----------------	--

Explanation

An IKE phase 2 negotiation failed because no proposal in the offer was accepted by the local security endpoint.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

rule is the name of a filter rule.

- In the policy agent configuration file, *rule* is the name of a IpFilterRule statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, *rule* is the name of a Connectivity Rule in GUI. *rule* also contains a numeric suffix appended to the Connectivity Rule name to guarantee uniqueness.

action is the action name.

- In the policy agent configuration file, *action* is the name specified on the applicable IpDynVpnAction statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, the action name corresponds to the name of the security level in the GUI. The action name also contains a numeric suffix appended to the security level name to guarantee uniqueness.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

This message will be accompanied by one or more EZD1093I messages. See the **User or Operator Response** in [EZD1093I](#) for information about resolving this negotiation failure.

System programmer response

None.

Module

policy.cpp

Procedure name

None.

EZD1025I**Cannot be an initiator of a phase 2 Security Association negotiation**

Explanation

The local IKE daemon is attempting to initiate a phase 2 security association (SA), and the local policy specifies that it can only act as a responder.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Check the server's configuration for phase 2 activation.

When configured without the IBM Configuration Assistant for z/OS Communications Server, the IKE daemon's phase 2 initiation role is set on the Initiation parameter in the IpDynVpnAction statement for this SA. If the local IKE server should be able to initiate the negotiation for this SA, then change the server's Initiation role in the appropriate IpDynVpnAction statement to **LocalOnly** or **Either**. See the information about the Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

When configured with the IBM Configuration Assistant for z/OS Communications Server, edit the corresponding Connectivity Rule in the GUI and check the Advanced IPsec: Dynamic Tunnel: How to Activate panel to see if local activation of phase 2 tunnels is allowed. See the online helps in the GUI for additional information.

System programmer response

None.

Module

policy.cpp

Procedure name

None.

EZD1026I**Cannot be a responder in a phase 2 Security Association negotiation**

Explanation

The local IKE daemon is attempting to respond to a phase 2 security association (SA) negotiation request and the local policy specifies that it can act only as an initiator.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Check the server's configuration for phase 2 activation.

When configured without the IBM Configuration Assistant for z/OS Communications Server, the IKE daemon's phase 2 initiation role is set on the Initiation parameter in the IpDynVpnAction statement for this SA. If the local IKE server should be able to be a responder in the negotiation for this SA, then change the server's Initiation role in the appropriate IpDynVpnAction statement to **RemoteOnly** or **Either**. See the information about the Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

When configured with the IBM Configuration Assistant for z/OS Communications Server, edit the corresponding Connectivity Rule in the GUI and check the Advanced IPsec: Dynamic Tunnels: How to Activate panel to see if remote activation of phase 2 tunnels is allowed. See the online helps in the GUI for additional information.

System programmer response

None.

Module

policy.cpp

Procedure name

None.

EZD1027I**Unsupported security endpoint identity type *id_type***

Explanation

An IKE request or negotiation failed because a security endpoint identity of an unsupported type was encountered. See the information about the Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#) for descriptions of LocalSecurityEndpoint and RemoteSecurityEndpoint statements.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

id_type is the security endpoint identity type.

System action

The IKE request or SA negotiation failed; IKE daemon processing continues.

Operator response

Ensure that the initiator's and the responder's IDs are defined correctly and try the request again.

System programmer response

None.

Module

pki390.cpp, fwconvert.c

Procedure name

None.

EZD1029I**Certificate usage value (*usage_value*) not supported**

Explanation

An IKE negotiation failed because the certificate usage value is not supported. The values currently supported are the integer representation of the digital signature flag or **any**. This error occurred when verifying the signature of the remote IKE daemon certificate.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

usage_value is the number that represents the certificate usage value.

System action

The certificate could not be verified and the message was not processed; IKE daemon processing continues.

Operator response

Ensure that the certificates of the responder of the IKE exchange are configured correctly. This error might be due to the remote security endpoint sending an unsupported certificate; ensure the remote security endpoint is using valid certificates.

System programmer response

None.

Module

asn_utils.cpp

Procedure name

None.

EZD1030I**The IKE daemon is not set up to support RSA signature mode of authentication for stack *stackname* using the local keyring**

Explanation

The Internet Key Exchange (IKE) daemon encountered an error while processing certificates located on the specified SAF key ring.

In the message text:

stackname

The name of the stack for which RSA signature mode of authentication is not available.

System action

The IKE daemon will not support RSA signature mode of authentication for the stack indicated by the *stackname* value; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

If RSA signature authentication is to be used, verify that the key ring database name is correct.

When configured without the IBM Configuration Assistant for z/OS Communications Server, the key ring database setting is specified on the IkeConfig statement with the KeyRing parameter. See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IkeConfig statement and the IKE daemon configuration file.

When configured with the IBM Configuration Assistant for z/OS Communications Server, the key ring database name is configured on the IPSec: IKE Daemon Settings panel. See the online helps in the GUI for additional information.

User response

Not applicable.

Problem determination

None.

Example

```
EZD1030I The IKE daemon is not set up to support RSA signature mode of authentication for stack
TCPCS
      using the local keyring
```

EZD1031I**DVIPA *dvipa_addr* added to the IKE daemon for stack *stackname***

Explanation

The Internet Key Exchange (IKE) daemon received an event from the TCP/IP stack to add a dynamic virtual IP address (DVIPA). The IKE daemon successfully added the DVIPA address to the stack indicated.

dvipa_addr is the dynamic virtual IP address that was added.

stackname is the stack to which the DVIPA was added.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

anchor.cpp

Procedure name

None.

EZD1032I	DVIPA <i>dvipa_addr</i> deleted from the IKE daemon for stack <i>stackname</i>
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon received an event from the TCP/IP stack to delete a dynamic virtual IP address (DVIPA). The IKE daemon successfully deleted the DVIPA address from the stack indicated.

dvipa_addr is the dynamic virtual IP address that was deleted.

stackname is the stack from which the DVIPA was deleted.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

anchor.cpp

Procedure name

None.

EZD1033I	IKE configuration file parameter <i>pname</i> contains value <i>val</i> which exceeds the maximum allowed character length <i>max_len</i> on line <i>linenum</i>
-----------------	---

Explanation

The IKE configuration file contains a parameter that contains a value that exceeds the maximum character length allowed.

In the message text:

pname

The parameter name.

val

The parameter value that has a length that is too long.

max_len

The maximum character length allowed for the parameter value.

linenum

The line of the configuration file where the parameter was found.

System action

If the error occurs during IKE startup, IKE configuration file processing ends, and the IKE daemon ends. If the error occurs as a result of a MODIFY REFRESH command, IKE configuration file processing ends, but IKE remains active. IKE configuration retains all values configured prior to the MODIFY REFRESH command.

Operator response

Contact the system programmer.

System programmer response

Replace the value for the parameter specified by the *pname* value with one that does not exceed maximum length.

User response

Not applicable.

Problem determination

None.

EZD1033I IKE configuration file parameter SupportedCertAuth contains value  A2345678901234567890123
which
    exceeds the maximum allowed character length 32  on line 6
```

EZD1034I

Phase 1 Security Association for DVIPA *dvipa_addr* is already re-established with its remote security endpoint *ip_addr*

Explanation

The Internet Key Exchange (IKE) daemon already re-established the phase 1 Security Association (SA) with its remote security endpoint. This phase 1 SA already existed prior to the dynamic virtual IP address (DVIPA) takeover or giveback.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

dvipa_addr is the dynamic virtual IP address.

ip_addr is the IP address of the remote security endpoint.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

anchor_ureq.cpp

Procedure name

None.

EZD1035I	Certificate cannot be used for RSA signature mode of authentication
-----------------	--

Explanation

IKE encountered a certificate that cannot be used for RSA signature mode of authentication; the IKE daemon currently supports only RSA signing IKEv1.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The certificate cannot be used and the negotiation will fail if the certificate is an end-entity certificate; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about the error and ask the administrator to verify that certificate sent to the IKE daemon for IKEv1 are using RSA signature mode. The administrator of the remote security endpoint should also verify that the key usage and the extended key usage extensions of the certificates that were sent support the creation and verification of digital signatures in an IKE flow. When the key usage extension is present, either the digital signature bit or the nonrepudiation bit must be set. When the key usage extension is present it must allow either any usage or usage with IKE.

Module

pki390.cpp

Procedure name

None.

EZD1036I

Phase 2 Security Association for DVIPA *dvipa_address* is not re-established with remote security endpoint *ip_addr*

Explanation

The Internet Key Exchange (IKE) daemon detected that the phase 2 Security Association (SA) for the dynamic virtual IP address (DVIPA). was not re-established with its remote security endpoint. An error might have occurred during the phase 2 SA negotiation process.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

dvipa_address is the dynamic virtual IP address.

ip_addr is the IP address of the remote security endpoint.

System action

The IKE phase 2 SA was not re-established for the DVIPA; IKE daemon processing continues.

Operator response

Check the IKE log for an entry indicating what the phase 2 SA negotiation error might be. Also, try to manually establish a phase 2 SA with the remote security endpoint by issuing the **ipsec -y activate** command.

See the information about the managing network security in z/OS Communications Server: IP System Administrator's Commands or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

System programmer response

None.

Module

phaseII_sa.cpp

Procedure name

None.

EZD1037I

The IKE daemon has no matching certificate entry for the specified LocalSecurityEndpoint identity (*id_string*) and certificate authority (*X.500_string*)

Explanation

The IKE message cannot be processed because no matching certificate entry was found. This error occurred while searching for a certificate that matched the LocalSecurityEndpoint ID and was signed by the CA that was requested by the remote security endpoint.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

id_string is a string representation of the LocalSecurityEndpoint ID.

X.500_string is the certificate authority.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Verify that the Local Security Endpoint Identity is correct. If it is correct, obtain a certificate with the expected ID of the local IKE server. When the certificate is obtained, add it to the IKE key ring with RACDCERT.

When configured without the IBM Configuration Assistant for z/OS Communications Server, the Local Security Endpoint is set on the LocalSecurityEndpoint statement. See the information about the [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the LocalSecurityEndpoint statement.

When configured with the IBM Configuration Assistant for z/OS Communications Server, edit the corresponding Connectivity Rule in the GUI and verify that the Local Security Endpoint Identify is correct. See the online helps in the GUI for additional information.

System programmer response

None.

Module

pki390.cpp

Procedure name

None.

EZD1038I	Remote security endpoint's certificate is not valid because the security association's lifetime is not in the certificate's lifetime
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon could not verify that the remote security endpoint certificate timeframe was valid. The current time is either before the certificate notBefore time value, or the lifetime of the Security Association (SA) is beyond the certificate notAfter time value.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The certificate cannot be used, and the SA negotiation will probably fail; IKE daemon processing continues.

Operator response

Verify that the remote security endpoint CA certificate was received. Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to verify that this certificate is valid and has a lifetime at which includes the current timeframe.

Module

pki390.cpp

Procedure name

None.

EZD1039I

IKE configuration file repeatable parameter *pname* was specified more than the allowed maximum of *max_num* times

Explanation

The IKE configuration file contains a repeatable parameter that was specified more times than is allowed.

pname is the repeatable parameter name.

max_num is the maximum number of times this repeatable parameter is allowed to be specified.

System action

If the error occurs during IKE startup, IKE configuration file processing ends, and the IKE daemon ends. If the error occurs due to a MODIFY REFRESH command, IKE configuration file processing ends, but IKE remains active. IKE configuration retains all values prior to the MODIFY REFRESH command.

Operator response

Change the IKE configuration file so that *pname* is specified no more than the value of *max_num*. See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file.

System programmer response

None.

Module

ike_config.cpp

Procedure name

None.

EZD1040I

**Phase *phase* Security Association retransmit timeout src IP : *src_spec*
dest IP : *dest_spec* src port : *src_port* dest port : *dest_port* protocol :
*protocol***

Explanation

The Internet Key Exchange (IKE) daemon exhausted the retransmit limit set for a single phase 1 or phase 2 message retransmission.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

phase is the phase (1 or 2) of this SA.

src_spec is the local security endpoint IP specification.

dest_spec is the remote security endpoint IP specification.

src_port is the source port.

dest_port is the destination port.
protocol is the protocol this SA used.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

This might occur if there are network problems or the remote security endpoint is not responding. Take corrective action if necessary, and try the negotiation again. If failures continue, ensure that the remote security endpoint is responding.

System programmer response

None.

Module

retrans.cpp

Procedure name

None.

EZD1041I	Error encountered when sending <i>ike_event</i> between src IP : <i>src_spec</i> dest IP : <i>dest_spec</i> src port : <i>src_port</i> dest port : <i>dest_port</i> protocol : <i>protocol</i> - <i>errno</i> <i>errnojr</i> <i>description</i>
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon detected an error while transmitting or retransmitting a message to a remote security endpoint.

- When configured without the IBM Configuration Assistant for z/OS Communications Server, messages will be transmitted based on the *IkeRetries* and *IkeInitWait* parameters on the *IkeConfig* statement. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about the *IkeConfig* statement.
- When configured with the IBM Configuration Assistant for z/OS Communications Server, messages will be retransmitted based on the Advanced: Phase 1 IKE key negotiation retry tuning and Phase 2 IKE data negotiation retry tuning settings in the corresponding Image in the GUI. See the online helps in the GUI for additional information.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

ike_event
The type of message sent.

src_spec
The local security endpoint address specification.

dest_spec
The remote security endpoint address specification.

src_port
The source port.

dest_port

The destination port.

protocol

The protocol being used.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

description

Describes the meaning of the *errno* value.

System action

The message was not successfully transmitted; IKE daemon processing continues.

Operator response

This might occur if there are network problems or the remote security endpoint is not responding. Take corrective action if necessary, and try the negotiation again. If failures continue, ensure that the remote security endpoint is responding.

System programmer response

None.

Module

infoXchg.cpp, phase1.cpp, phaseII_sa.cpp, retrans.cpp, sa.cpp

Procedure name

EZD1042I

**IKE CONFIGURATION FILE ERROR : MODIFY REFRESH COMMAND IS
REJECTED - IKE DAEMON IS USING CONFIGURATION VALUES PRIOR
TO COMMAND**

Explanation

An error occurred while processing the IKE configuration file during a MODIFY REFRESH command. The MODIFY REFRESH command is rejected and the IKE daemon uses all the configuration values that were specified prior to the command.

System action

MODIFY REFRESH command is rejected.

Operator response

Correct the configuration file error and re-enter the MODIFY REFRESH command.

System programmer response

None.

Module

mdfysrvr.c

Procedure name

None.

EZD1043I	Unable to open message catalog (<i>catalog_name</i>) <i>errno</i> <i>errnojr</i> <i>description</i> - default messages will be used
-----------------	--

Explanation

The specified message catalog cannot be opened. This might occur if the catalog is missing, corrupted, or has incorrect permissions. This might also occur if the IKE daemon cannot find the catalog because environment variables or paths are set up incorrectly on the system. The NLSPATH environment variable is used to set the location of the message catalog. By default, this variable is set to /usr/lib/nls/msg/%L/%N.

catalog_name is the name of the catalog that the IKE daemon attempted to open.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

description describes the meaning of *errno*.

System action

IKE daemon processing continues and will use internal default messages instead of messages from the external message catalog.

Operator response

If you want to use the external message catalog, correct the indicated error and restart the IKE daemon. If the default messages are acceptable, no action is necessary. See the information about the [NLSPATH environment variable](#) in [z/OS UNIX System Services Programming Tools](#).

System programmer response

None.

Module

fwutil.c

Procedure name

None.

EZD1044I	The ID (<i>id_X.500_string</i>) sent by the remote security endpoint in the ID payload does not match the subject name or any of the subject alternate names in the certificate used by the remote security endpoint to generate its signature
-----------------	---

Explanation

The IKE negotiation will probably fail because the identities in the ID payload and in the certificate do not match. This mismatch occurred during verification of the remote security endpoint identity while using digital signature mode authentication.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

id_X.500_string is the X.500 string from the ID payload.

System action

The certificate cannot be used and the negotiation will probably fail; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint about this error and ask the administrator to ensure that they are using a certificate that matches the identity they are sending.

Module

pki390.cpp

Module

main.cpp

Procedure name

None.

EZD1049I**IKE INITIALIZATION FAILURE**

Explanation

The Internet Key Exchange (IKE) daemon failed to initialize.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The IKE daemon ends.

Operator response

Check for other messages in syslog with the same message instance number to indicate the reason for the failure. If the problem can be corrected, start the IKE daemon again. If the problem continues, notify the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

fw_initterm.c

Procedure name

None.

EZD1051I

Phase 1 Security Association for DVIPA *DVIPA_addr* is not re-established with remote security endpoint *ip_addr*

Explanation

During a dynamic virtual IP address (DVIPA) takeover or giveback, the IKE daemon detected that the phase 1 Security Association (SA) for the specified DVIPA address was not re-established with its remote security endpoint. An error might have occurred during the phase 1 SA negotiation process.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

DVIPA_addr is the dynamic virtual IP address.

ip_addr is the IP address of the remote security endpoint.

System action

The IKE phase 1 SA was not re-established for the DVIPA; IKE daemon processing continues.

Operator response

Check the logs for an entry indicating what the phase 1 SA negotiation error is.

System programmer response

None.

Module

sa.cpp

Procedure name

None.

EZD1052I

Phase 1 Security Association for DVIPA *DVIPA_addr* is re-established with remote security endpoint *ip_addr*

Explanation

During a dynamic virtual IP address (DVIPA) takeover or giveback, the IKE daemon successfully re-established the phase 1 Security Association (SA) with the specified remote security endpoint.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

DVIPA_addr is the dynamic virtual IP address.

ip_addr is the IP address of the remote security endpoint.

System action

The IKE phase 1 SA is re-established for the DVIPA.

Operator response

None.

System programmer response

EZD1053I	Discontiguous subnet mask <i>mask</i> is prohibited
-----------------	--

Explanation

Discontiguous subnet masks, for example 255.0.0.255, are not permitted to be proposed in a Security Association (SA) negotiation.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

mask is the discontiguous subnet mask that is rejected by the IKE daemon.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Ensure that all IKE peers configure contiguous subnet masks for tunnel negotiations.

System programmer response

None.

Module

config_adapter.cpp

Procedure name

None.

EZD1054I	Request to <i>request</i> could not be completed
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon did not successfully complete the request specified.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

request is the request that could not be completed. *request* is one of the following:

- **establish phase 1 Security Association**

- **establish phase 2 Security Association**
- **activate phase 2 Security Association**
- **refresh Security Association**
- **refresh phase 2 Security Association**
- **expire Security Association**
- **handle stack stop**
- **activate on-demand Security Association**
- **complete asynchronous verification request**
- **repopulate phase 1 Security Association**
- **complete DVIPA event**
- **display Security Association information**
- **activate auto-activate Security Association**
- **deactivate Security Association**
- **update policy**

System action

The request failed; IKE daemon processing continues.

Operator response

See other messages that have the same message instance number to correct the problem, and try the operation again.

System programmer response

None.

EZD1057I

Unsupported configuration : *endpoint* data endpoint *address* is specified as a *type* for a transport mode Security Association initiated *mode*

Explanation

A data endpoint was specified as an IP subnet or IP address range for a transport mode Security Association (SA). Only single IP address types are supported.

endpoint is either **local** or **remote**.

address is the base address value specified in the configuration policy.

type indicates whether the configuration specified subnet or range.

mode indicates whether the SA was initiated locally or remotely.

System action

The dynamic tunnel activation fails; IKE daemon processing continues.

Operator response

If you want a single SA to protect traffic for an IP subnet or IP address range, then configure a tunnel mode SA. If the message indicates that the SA was initiated locally, then change the local configuration. If the message indicates that the SA was initiated remotely, then the configuration on the remote system must be changed. See the information about the Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring dynamic tunnels.

System programmer response

None.

Module

policymgr.cpp

Procedure name

None.

EZD1060I **IKE CONNECTION TO PAGENT FAILED**

Explanation

The Internet Key Exchange (IKE) daemon failed to connect to the Policy Agent (PAGENT).

System action

The IKE daemon ends.

Operator response

Start PAGENT before starting the IKE daemon.

System programmer response

None.

Module

polycymgr.cpp

Procedure name

None.

EZD1061I**IKE CONNECTING TO PAGENT****Explanation**

The Internet Key Exchange (IKE) daemon is connecting to the Policy Agent (PAGENT).

System action

The IKE daemon waits for the PAGENT connection to complete.

Operator response

None.

System programmer response

None.

Module

polycymgr.cpp

Procedure name

None.

EZD1062A**IKE RETRYING CONNECTION TO PAGENT [FOR *max_wait* SECONDS]****Explanation**

The Internet Key Exchange (IKE) daemon is trying the connection to the Policy Agent (PAGENT) again.

max_wait is the maximum amount of time, in seconds, that the IKE daemon will continue to try connecting to PAGENT again. The absence of this information indicates that the IKE daemon will keep trying indefinitely.

System action

IKE daemon processing continues to try the connection to PAGENT again.

Operator response

Confirm that PAGENT is started.

System programmer response

None.

Module

polycymgr.cpp

Procedure name

None.

EZD1063I**IKE DISCONNECTING FROM PAGENT****Explanation**

The Internet Key Exchange (IKE) daemon is disconnecting from the Policy Agent (PAGENT).

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

policymgr.cpp

Procedure name

None.

EZD1064I**MODIFY COMMAND OPTION (*opt*) IS NOT SUPPORTED****Explanation**

The MODIFY command option *opt* is not a supported option for the IKE daemon.

opt is the option that is not supported.

System action

The IKE configuration file processing ended, but the IKE daemon remains active. The IKE configuration retains all values prior to the MODIFY command.

Operator response

See the information about the [MODIFY command](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for information the correct syntax of the MODIFY command.

System programmer response

None.

Module

mdfysrvr.c

Procedure name

None.

Explanation

The Internet Key Exchange (IKE) daemon was unable to establish a socket for the specified port and stack. To negotiate security associations for an IPSECURITY stack, the IKE daemon must be able to establish sockets on ports 500 and 4500 for the stack.

port is the port for which the IKE daemon was trying to establish a socket. Possible values are 500 or 4500.

stackname is the name of the stack for which the socket could not be established.

System action

The IKE daemon is unable to negotiate security associations for the given stack.

Operator response

Check syslog for other messages that indicate errors that might prevent the IKE daemon from establishing the specified socket and contact the system programmer.

System programmer response

Ensure that ports 500 and 4500 are not reserved for use by another application.

Module

simple_net.cpp

Procedure name

None.

Explanation

The Internet Key Exchange (IKE) daemon started processing a MODIFY command.

System action

IKE daemon processing continues to process the MODIFY command.

Operator response

None.

System programmer response

None.

Module

mdfysrvr.c

Procedure name

None.

EZD1067I

**IKE configuration file parameter (*pname*) is non-refreshable on line
*linenum***

Explanation

The IKE configuration file parameter *pname* cannot be refreshed using the MODIFY command.

In the message text:

pname

The parameter that cannot be refreshed.

linenum

The line of the configuration file where the parameter was found.

System action

The IKE daemon configuration processing continues.

Operator response

None.

System programmer response

None.

User response

Not applicable.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

ike_config.cpp

Routing code

12

Example

```
EZD1067I IKE configuration file parameter (KeyRing) is non-refreshable on line 5
```

EZD1068I

IKE POLICY UPDATED FOR STACK *stackname*

Explanation

IKE policy lists were successfully updated for the specified stack. An ESD1070I message can be found in syslog for any of the IKE policy lists that were updated (up to 5 lists can be updated).

stackname is the name of the stack that had a policy update.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

polycmgr.cpp

Procedure name

PMAdd_PolicyCacheForStack

ESD1069I**IKE POLICY UPDATE FAILED FOR STACK *stackname***

Explanation

An IKE policy list failed to be successfully built, therefore none of the policy list changes will be performed for this stack. This message indicates that the IKE policy lists were not updated because a failure was detected when building an IKE policy list. All the policy lists that were successfully built will be deleted and this stack will use the prior policy information. Also, an ESD1071I message can be found in syslog for the IKE policy list that could not be built. There might be ESD1070I messages for each of the IKE policy lists that were successfully built (these lists are deleted when the build error is detected for an IKE policy list).

stackname is the name of the stack for which the policy update failed.

System action

IKE policy information will not be updated; IKE daemon processing continues.

Operator response

You can use the MODIFY REFRESH command to modify the PAGENT policy information, which will cause the IKE daemon to receive an asynchronous notification of the changes to policy information. Then verify that an ESD1068I message is reported on the console or in syslog to indicate that the IKE policy information was successfully updated for this stack. If the problem persists, contact the system programmer.

System programmer response

The failure might be the result of IKED not having RACF authority to access the policies. See [Steps for authorizing the IKE daemon to RACF](#) in *z/OS Communications Server: IP Configuration Guide* for more information. Otherwise, contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

polycymgr.cpp

Procedure name

PMConnect function or policyAsync exit

EZD1070I **IKE policy list *policy-list-name* updated for stack *stackname***

Explanation

An IKE policy list was successfully updated. This message will be displayed in syslog for all policy lists that the IKE daemon successfully updated. EZD1068I will be sent to the console and syslog when all lists were successfully updated. This message might be issued when a subsequent policy list fails to be updated (for which an EZD1071I message will be recorded), and an EZD1069I message will be sent to the console and to the syslog. In a failure case, all the previously successfully built policy lists indicated by the EZD1070I message will be deleted.

policy-list-name is the name of the IKE policy list and has one of the following values:

- **KeyExchangeRule**
- **IpDynVpnAction**
- **IpLocalStartAction**
- **LocalDynVpnRule**
- **AutoActLocalDynVpnRule**

stackname is the TCP/IP stack name for which this IKE policy is being updated.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

polycache.cpp

Procedure name

PCBuild_KeyExchangeRule_List(), PCBuild_IpDynVpnAction_List(), PCBuild_IpLocalStartAction_List(), PCBuild_LocalDynVpnRule_List(), PCBuild_AutoActLocalDynVpnRule_List() functions

EZD1071I **IKE policy list *policy-list-name* update failed for stack *stackname***

Explanation

An error was detected when attempting to build an IKE policy list. This message will be displayed in syslog for the policy lists for which the error was detected, followed by EZD1069I (sent to the console and syslog), to indicate that the IKE policy lists were not updated. All the previous IKE policy lists that were successfully built, which are indicated by an EZD1070I message, will be deleted.

policy-list-name is the name of the IKE policy list and has one of the following values:

- **KeyExchangeRule**
- **IpDynVpnAction**
- **IpLocalStartAction**
- **LocalDynVpnRule**
- **AutoActLocalDynVpnRule**

stackname is the stack name for which this IKE policy is being updated.

System action

IKE policy information is not updated; IKE daemon processing continues.

Operator response

Use the MODIFY REFRESH command to modify the PAGENT policy information, which will cause the IKE daemon to receive an asynchronous notification of the changes to policy information. Then verify that an EZD1068I message is reported on the console or syslog to indicate that the IKE policy information was successfully updated for this stack. If the problem persists, contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

polycache.cpp

Procedure name

PCBuild_KeyExchangeRule_List(), PCBuild_IpDynVpnAction_List(), PCBuild_IpLocalStartAction_List(), PCBuild_LocalDynVpnRule_List(), PCBuild_AutoActLocalDynVpnRule_List() functions

EZD1072I **Unable to find Security Association by cookies (*initiator_cookie* / *responder_cookie*) between (*local_ip* / *remote_ip*)**

Explanation

The Internet Key Exchange (IKE) daemon was unable to locate a Security Association (SA) in the SA table with the specified cookie pair.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

initiator_cookie is the 8-byte hexadecimal value of the initiator cookie.

responder_cookie is the 8-byte hexadecimal value of the responder cookie.

local_ip is the local IP address.

remote_ip is the remote IP address.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

This error might be caused by receiving an incorrect cookie from the remote security endpoint when the IKE daemon is recycled during an SA negotiation or when additional messages are received after an SA is deactivated. If none of these actions happened, contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

anchor_msg.cpp

Procedure name

None.

EZD1073I	Error reading ipsec command request : errno <i>errno</i> (<i>description</i>) errnojr <i>errnojr</i>
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon detected an error reading an **ipsec** command request.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description describes the meaning of *errno*.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The command request ends; IKE daemon processing continues.

Operator response

This error might be caused by a temporary restraint on resources; try the command again.

System programmer response

None.

Module

simple_cmd_req.cpp

Procedure name

None.

EZD1074I	Error writing ipsec command response : errno <i>errno</i> (<i>description</i>) errnojr <i>errnojr</i>
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon detected an error writing an **ipsec** command response.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description describes the meaning of *errno*.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The command request ends; IKE daemon processing continues.

Operator response

This error might be caused by a temporary restraint on resources; try the command again.

System programmer response

None.

Module

simple_cmd_req.cpp

Procedure name

None.

EZD1075I **Received ISAKMP error notification message : *err_msg_type***

Explanation

The Internet Key Exchange (IKE) daemon received an ISAKMP error notification message. This error indicates that a Security Association (SA) negotiation failure occurred.

err_msg_type is the type of ISAKMP error notification received.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Use the *err_msg_type* value to identify the failure and verify that the security policy is specified correctly.

See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

System programmer response

None.

Module

infoXchg.cpp

Procedure name

None.

Explanation

An error was encountered while processing a distinguished name (DN).

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

function is the name of the function that returned an error.

ec is the error code from the function specified. For a list of common error codes returned by these functions, see the [z/OS Cryptographic Services System SSL Programming](#).

dn is the distinguished name that is being processed if the function returning the error was `gsk_dn_to_name()`.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

These errors are usually caused by incorrectly formed DNs. See RFC 2253 for more information about forming DNs and check the DNs in your policy configuration file for incorrect characters (such as surrounding double quotes) and try the operation again. See [Appendix A, “Related protocol specifications,” on page 1471](#) for directions on how to get a copy of the RFC.

System programmer response

None.

Module

fwconvert.cpp

Procedure name

None.

Explanation

An IKE negotiation failed because the IKE daemon was unable to find the IpDynVpnAction specified.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

name is the IpDynVpnAction that could not be found.

System action

The Security Association negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

polycmgr.cpp

Procedure name

None.

EZD1079I **IKE POLICY PURGED FOR STACK *stackname***

Explanation

IKE policy lists have been successfully purged for the specified stack.
stackname is the name of the stack that had a policy purge.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

polycmgr.cpp

Procedure name

None.

EZD1081I **Could not find the IpLocalStartAction named *name***

Explanation

An IKE negotiation failed because the IKE daemon was unable to find the IpLocalStartAction specified.
Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.
name is the IpLocalStartAction that could not be found.

System action

The Security Association negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide a CTRACE for component SYSTCPIK.

Module

polycmgr.cpp

Procedure name

None.

EZD1082I	Could not find the LocalDynVpnRule named <i>name</i>
-----------------	---

Explanation

An IKE negotiation failed because the IKE daemon was unable to find the LocalDynVpnRule specified.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

name is the LocalDynVpnRule that could not be found.

System action

The Security Association negotiation fails; IKE daemon processing continues.

Operator response

Ensure that the LocalDynVpnRule name matches a configured LocalDynVpnRule. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about the LocalDynVpnRule statement.

System programmer response

None.

Module

polycmgr.cpp

Procedure name

None.

EZD1083I	Local policy (<i>p1_action_name</i>) does not allow local initiation of a phase 1 Security Association negotiation
-----------------	---

Explanation

The local IKE daemon is attempting to initiate a phase 1 Security Association (SA) negotiation, but the local policy specifies that it cannot be the initiator.

p1_action_name is the name of the action.

- In the policy agent configuration file, *p1_action_name* is the name of the KeyExchangeAction statement associated with this negotiation.

- When configured with the IBM Configuration Assistant for z/OS Communications Server, *p1_action_name* corresponds to the name of a Connectivity Rule in the GUI. *p1_action_name* also contains a numeric suffix appended to the Connectivity Rule name to guarantee uniqueness.

System action

The SA negotiation failed; IKE daemon processing continues.

Operator response

Check the IKE daemon's initiation role for this SA.

When configured without the IBM Configuration Assistant for z/OS Communications Server, if the local IKE daemon should be able to initiate the negotiation for this SA, then change the daemon's *HowToInitiate* parameter in the appropriate *KeyExchangeAction* statement to **main** or **aggressive**. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

When configured with the IBM Configuration Assistant for z/OS Communications Server, if the local IKE daemon should be able to initiate the negotiation for this SA, then edit the corresponding Connectivity Rule GUI and change the Initiator mode setting on the Advanced IPsec: Dynamic Tunnels: Key Exchange Settings panel to either **Main** or **Aggressive**. See the online helps in the GUI for additional information.

System programmer response

None.

Module

policy.cpp

Procedure name

None.

EZD1085I	A message was discarded because it was received from a remote peer behind an NAPT - src IP : <i>sourceIP</i> src port : <i>sourceport</i> dest IP :<i>destIP</i> dest port : <i>destport</i>
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon is not permitted to allow a Security Association (SA) with a remote peer behind a network address port translation (NAPT). Therefore, any IKE message received from a remote peer with a source port other than 500 or 4500 will be discarded.

sourceIP is the source IP address.

sourceport is the source port.

destIP is the destination IP address.

destport is the destination port.

System action

The IKE message from the remote peer will be discarded; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that the IKE daemon cannot accept messages from a peer behind an NAPT.

Module

simple_net.cpp

Procedure name

None.

EZD1086I	Negotiating a phase 1 Security Association due to a remote security endpoint IP address change - original IP address / port : <i>origip</i> / <i>origport</i> changed IP address / port : <i>changedip</i> / <i>changedport</i>
-----------------	--

Explanation

A new phase 1 Security Association (SA) is being negotiated because an IP address change was detected for a remote security endpoint. This occurrence is usually related to a re-boot of the NAT device. If this new phase 1 negotiation completes successfully, then all of the previous SAs with the remote security endpoint are deleted. If this negotiation successfully completes, message EZD1087I will be issued, or if the negotiation fails, message EZD1102I will be issued.

origip is the IP address of the established SA.

origport is the port of the established SA.

changedip is the new IP address.

changedport is the new port.

System action

A new phase 1 SA is negotiating; IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

sa.cpp

Procedure name

None.

EZD1087I	Negotiation of a phase 1 Security Association due to a remote security endpoint IP address change succeeded - original IP address / port : <i>origip</i> / <i>origport</i> new IP address / port : <i>newip</i> / <i>newport</i>
-----------------	---

Explanation

This message indicates that the phase 1 Security Association (SA) being negotiated in response to a remote security endpoint IP address change succeeded. This message is associated with a previously issued EZD1086I message.

origip is the IP address of the previously established SA.

origport is the port of the previously established SA.

newip is the new IP address.

newport is the new port.

System action

Negotiation of the phase 1 SA succeeds; IKE daemon processing continues.

Operator response

Contact the system programmer if this message is seen often.

System programmer response

If this message is seen often, determine the cause of the IP address change. It might be caused by a reboot of the NAT device in front of the remote peer or by an expired NAT mapping. Notify the administrator of the remote security endpoint about the error. If the change is caused by an expired NAT mapping, the administrator of the remote security endpoint should take action to prevent future NAT mapping expirations.

Module

oakley_kep.cpp

Procedure name

None.

EZD1088I	IKE received an unsupported <i>identity</i> address type (<i>idtype</i> - <i>idtypestr</i>) for a Security Association traversing a NAT
-----------------	--

Explanation

An identity address must be specified as a single IPv4 address.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

identity

Possible values are:

IDci

The identity address type of the initiator.

IDcr

The identity address type of the responder.

NAT-OA

The NAT original address.

idtype

The number of the identity address type that is not supported. These values are defined in RFC2407. See [Appendix A, “Related protocol specifications,” on page 1471](#) for information about accessing RFCs.

idtypestr

The identity address type that is not supported. If the identity address type is not known, the value of *idtypestr* is Unknown.

System action

The phase 2 SA negotiation fails; IKE daemon processing continues.

System programmer response

Ensure that only single IPv4 addresses are specified as data endpoints when traversing a NAT. Notify the administrator of the remote security endpoint and ask the administrator to ensure that only single IPv4 addresses are specified as data endpoints when traversing a NAT.

User response

Contact the system programmer.

Module

oakley_phaseII.cpp

Example

None.

EZD1089I

A tunnel mode Security Association traversing a NAT does not have its local IPSec traffic endpoint residing on this node

Explanation

During the negotiation of a tunnel mode Security Association (SA), it was determined that the local IPSec traffic endpoint did not end on this z/OS node. z/OS is providing NAT Traversal support for a defined group of configurations where z/OS is running the IKE daemon. See the information about [IP security in z/OS Communications Server: IP Configuration Guide](#) for a description of the supported configurations.

System action

The tunnel mode SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Alter the local policy configuration so that the local IPSec traffic endpoint is local to this z/OS.

When configured without the IBM Configuration Assistant for z/OS Communications Server, in the policy agent configuration file, this IP address is the IpSourceAddr parameter on the IpFilterRule. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

When configured with the IBM Configuration Assistant for z/OS Communications Server, edit the corresponding Connectivity Rule in the GUI and ensure the local data endpoint address is one that is local to the TCP/IP stack. Gateway-to-host and gateway-to-gateway topologies are not supported for NAT. See the online helps in the GUI for additional information.

Module

oakley_phaseII.cpp

Procedure name

None.

EZD1090I

Initiation of a phase 2 Security Association negotiation for a new dynamic tunnel failed because the remote security endpoint is a security gateway

Explanation

When traversing a NAT, a local initiation of a phase 2 Security Association (SA) for a new dynamic tunnel with a remote security endpoint that is a security gateway is not supported. To use this configuration, the remote security endpoint must be the initiator. z/OS is providing NAT traversal support for a defined group of configurations where z/OS is running the IKE daemon. See the information about [IP security in z/OS Communications Server: IP Configuration Guide](#) for a description of the supported configurations.

System action

The phase 2 SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that it must be the initiator when using this configuration.

Module

sa.cpp

Procedure name

None.

EZD1092I

**Protocol error encountered during phase *phase* message processing
rsn=rsn - message discarded**

Explanation

A protocol error occurred during IKE message processing. The *rsn* field provides more information about the received message.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

phase is 1 or 2 indicating the phase of negotiation when the error occurred.

rsn is the reason code that provides additional information about the received message. Possible values are:

1

The first payload in the quick mode (phase 2) message was not a hash payload.

- 2** The second payload in message 1 or 2 of a quick mode (phase 2) exchange was not a Security Association payload.
- 3** A quick mode (phase 2) message was not encrypted.
- 4** The received message contained unexpected payloads or was missing payloads that are required by RFC 2409 (The Internet Key Exchange).
- 5** The received message did not contain the required number of NAT-OA payloads.
- 6** The received message contained too many NAT-OA payloads.
- 7** The received message utilized an unexpected port.
- 9** The message length indicated in the ISAKMP header of the message is too large.
- 10** The received message is missing a required key exchange, NONCE payload, or both.
- 11** The received message is missing a required ID payload.
- 12** The received message is missing a required hash or signature payload.
- 13** The received message contains Diffie-Hellman information that is too long.
- 17** The received message did not contain an expected certificate payload.
- 101** The received message is too short to be a valid ISAKMP message.
- 102** The received message is too large to buffer.
- 103** The received message contains a next payload field that is unrecognized.
- 104** The received message does not contain a valid ISAKMP major and minor version.
- 105** The received message's exchange type is not supported.
- 106** The received message contains no payloads.
- 107** The received message contains a payload that is shorter than the reported size.
- 108** The received message contains a payload that is longer than the reported size.
- 109** The received message contains a payload with no data.
- 110** The received message contains a payload that is not the correct payload size.
- 111** The received message contains an incorrect SPI size.
- 112** The received message contains non-zero data in a field that must be set to 0.

- 113**
The received message contains an unsupported Domain Of Interpretation (doi) value.
- 114**
The received message contains an unsupported situation value.
- 115**
The received message contains an unsupported protocol value.
- 116**
The received message contains an unsupported ID type value.
- 117**
The received message contains an unsupported certificate type value.
- 118**
The received phase 1 message 1 contains encrypted data.
- 120**
The received message contains an SA payload without a required hash payload.
- 121**
The received message contains non-SA payloads before the first SA payload.
- 122**
The received message does not contain a proposal payload in the required order.
- 123**
The received message does not contain a transform payload in the required order.
- 124**
The received message contains an incorrect size for the ID type received.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that a protocol error has occurred.

Module

oakely_phaseII.cpp

Procedure name

None.

EZD1093I	Policy mismatch : <i>statement (state_num)</i> requires parameter (<i>parameter</i>) with value (<i>policy_val</i>) but proposal (<i>prop_num</i>) value is (<i>prop_val</i>)
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon was unable to accept a proposal because there was a mismatch in the configured policy. IKE daemon processing continues to the next proposal. If no proposals are accepted, the Security Association negotiation will fail. This will be indicated by an EZD0985I, EZD1021I, or EZD1022I message later in syslog.

statement indicates whether the mismatched parameter was configured on the KeyExchangeOffer, IpDataOffer, or IpDynVpnAction statement in the policy configuration file.

When configured with the IBM Configuration Assistant for z/OS Communications Server:

- The KeyExchangeOffer statements are located on the corresponding Connectivity Rule's Advanced IPsec: Dynamic Tunnels: Key Exchange Settings panel. Use the KeyExchangeRule name from message EZD1021I to identify the Connectivity Rule.
- The IpDataOffer statement is located in the corresponding security level. However, if the parameter is HowToEncap, this setting is located on the Connectivity Rule's Advanced IPsec: Dynamic Tunnels: OnDemand Granularity / Encapsulation Mode panel. Use the DynVpnAction name from message EZD1022I to identify the security level. Use the IpFilerRule name from message EZD1022I to identify the Connectivity Rule.
- The IpDynVpnAction statement corresponds to the security level in the GUI. Use the DynVpnAction name from message EZD1022I to identify the corresponding security level.

state_num is the number of a statement referenced from the policy. The number corresponds to the order of the references in the policy. Therefore, the first statement referenced from the policy would have number 1 in this message.

parameter is the parameter that encountered a mismatch. If parameter is ExtendedSequenceNumbers, this value is not configurable in z/OS policy. For all other values of parameter, see the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about the parameter specified, or "No" if the parameter is ExtendedSequenceNumbers.

policy_val is the value that is configured in the policy.

prop_num is the number of the proposal that is being compared. The number corresponds to the order of proposals in an offer received. Therefore, the first proposal received in an offer would have number 1 in this message.

prop_val is the value contained in the proposal for this parameter.

System action

If the IKE daemon does not accept any of the proposals, the negotiation fails; IKE daemon processing continues.

Operator response

If the proposal that contains the mismatch is the one that should be accepted, either alter the local policy to accept the value in this proposal or notify the administrator of the remote security endpoint about the mismatch and ask the administrator to alter the remote configuration to propose the correct values.

See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

EZD1094I

IKE STATUS FOR STACK *stackname* IS DOWN

Explanation

The Internet Key Exchange (IKE) daemon detected a status change for a stack. The IKE daemon can establish Security Associations only for a stack with status UP. The IKE daemon might detect a stack status change for several reasons such as normal termination of the stack while the IKE daemon is running.

stackname is the name of the stack that has changed status.

System action

IKE daemon processing continues.

Operator response

If the status change is unexpected, check the log for related messages from the IKE daemon or the stack.

System programmer response

None.

Module

stackobj.cpp

Procedure name

None.

EZD1095I

Unsupported configuration : *location* data endpoint *dataaddr* does not match security endpoint *endptaddr* for a transport mode Security Association initiated *method*

Explanation

The IP address for the data endpoint must be the same as the IP address for the security endpoint when using a transport mode Security Association (SA).

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

location describes the data endpoint. The possible values are **local** and **remote**.

dataaddr is the data endpoint IP address.

endptaddr is the security endpoint IP address.

method describes how the SA was initiated. The possible values are **locally** and **remotely**.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

If the data endpoint and security endpoint are different, use a tunnel mode SA; otherwise change the configuration so that the data endpoint and security endpoint addresses match. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

System programmer response

None.

Module

policy.cpp

Procedure name

None.

EZD1096I Local IP address *addr* is not available

Explanation

The source address used for a Security Association (SA) negotiation must be an address owned by the stack. If the local address is a distributed DVIPA, then the stack must be acting as the distributor.

addr is the source address for the attempted negotiation.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

If the SA negotiation was locally activated, verify that the IP address is local to this stack. Use the Netstat HOME/-h command to view the list of IP addresses local to this stack. See the information about the Netstat HOME/-h in [z/OS Communications Server: IP System Administrator's Commands](#) for information about displaying the Netstat HOME/-h report.

When configured without the IBM Configuration Assistant for z/OS Communications Server, check for LocalDynVpnRule statements with LocalIp or LocalIpRef parameters that specify an IP address that is not local to this stack and, if necessary, correct the policy. See the information about the [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

When configured with the IBM Configuration Assistant for z/OS Communications Server, edit the corresponding Connectivity Rule in the GUI and verify that the local IP address is local to this stack. If your local data endpoint is a single IP address, verify that it is local to this stack. If the local data end point value is an asterisk (*), verify that your Advanced IPsec: Dynamic Tunnels: Local Activation Settings are correct and contain only IP addresses local to this stack. See the online helps in the GUI for additional information.

System programmer response

None.

Module

anchor_ureq.cpp

Procedure name

EZD1097I Phase 2 Security Association for DVIPA *dvipa_addr* is re-established with remote security endpoint *ip_addr*

Explanation

During a DVIPA takeover or giveback, the IKE daemon successfully re-established the phase 2 Security Association (SA) with the specified remote security endpoint.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

dvipa_addr is the dynamic virtual IP address.

ip_addr is the IP address of the remote security endpoint.

System action

The IKE phase 2 SA is re-established for the DVIPA; IKE daemon processing continues.

Operator response

None.

System programmer response

None.

Module

phaseII_sa.cpp

Procedure name

None.

EZD1098I	Protocol error encountered during phase <i>phase</i> message processing rsn=<i>rsn</i> - negotiation continues
-----------------	---

Explanation

A protocol error occurred during IKE message processing. The *rsn* field provides more information about the received message.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

phase is 1 or 2 indicating the phase of the negotiation when the error occurred.

rsn is the reason code that provides additional information about the received message. Possible values are:

- 1** A NAT-D payload received contained an invalid hash length. NAT detection cannot be performed.
- 2** The use of NAT traversal was agreed to but the remote security endpoint did not send the minimum number of NAT-D payloads required.

System action

The SA negotiation continues; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that a protocol error has occurred.

Module

oakley_kep.cpp

Procedure name

None.

EZD1099I	A message generated dump has been created titled : <i>title</i>
-----------------	--

Explanation

An IKE daemon message generated an address space dump. The message that generated the dump appears immediately after this message in the system log.

title is the text associated with the dump. The title contains the message number and associated message text that caused the dump to be generated.

System action

After the dump is created, IKE daemon processing continues processing.

Operator response

Contact the system programmer.

System programmer response

Capture the system log and the generated dump. Contact IBM software support services to analyze this data.

Module

fwutil.c

Procedure name

None.

EZD1100I	A message generated dump was suppressed for message : <i>message_number</i>
-----------------	--

Explanation

An IKE daemon message attempted to generate an address space dump. However, no more than two message-generated dumps can be created in a 15 minute period. Due to this criteria, the dump was suppressed. The message that attempted to generate the dump appears immediately after this message in the system log.

message_number is the message number of the message that attempted to generate the dump.

System action

IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Capture the system log and any message-generated dumps that were created earlier. Contact IBM software support services to analyze this data.

Module

fwutil.c

Procedure name

None.

EZD1101I	NAT detected and no valid IpDataOffers found
-----------------	---

Explanation

This message is issued when no valid IpDataOffers are found during a negotiation traversing a NAT. When a NAT is being traversed, all IpDataOffers utilizing the AH protocol are ignored. To negotiate a security association (SA) in a NAT traversal environment, at least one Data Offer that does not contain authentication with AH must be configured.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Ensure that at least one data offer does not contain authentication with AH.

When configured without the IBM Configuration Assistant for z/OS Communications Server, ensure that at least one IpDataOffer has ESP or DoNot configured on the HowToAuth parameter in the configuration policy. See the information about the [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

When configured with the IBM Configuration Assistant for z/OS Communications Server, ensure that the security level in the GUI contains at least one Data Offer that either does not use Authentication or uses Authentication with the ESP authentication protocol. See the online helps in the GUI for additional information.

Module

policy.cpp

Procedure name

None.

EZD1102I	Negotiation of a phase 1 Security Association due to a remote security endpoint IP address change failed - original IP address / port : <i>origip / origport</i> failed IP address / port : <i>filaedip / failedport</i>
-----------------	---

Explanation

This message indicates that a phase 1 Security Association (SA) being negotiated in response to a detected remote security endpoint IP address change failed. The changed IP address (*filaedip*) that caused the negotiation might be caused by a reboot of the NAT device in front of the remote security endpoint or an expired

NAT mapping. The changed IP address (*filaedip*) might also be caused by a packet with an address that is not valid. This message is associated with a previously issued EZD1086I message.

origip is the IP address of the established SA.

origport is the port of the established SA.

filaedip is the IP address of the failed negotiation.

failedport is the port of the failed negotiation.

System action

Negotiation of the phase 1 SA fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Check other messages in the system log with this IP address to determine the cause of the failure. If necessary, notify the administrator of the remote security endpoint about this error

Module

anchor_ureq.cpp, oakley_kep.cpp, oakley_phaseII.cpp, sa.cpp

Procedure name

EZD1104I**IKE detected a NAT while initiating a new dynamic tunnel using only tunnel mode IpDataOffers with a non-z/OS peer****Explanation**

The Internet Key Exchange (IKE) daemon is initiating a tunnel-mode Security Association (SA) for a new dynamic tunnel with a non-z/OS peer. The SA traverses a NAT. There might be problems with interoperability with the non-z/OS peer for a tunnel-mode SA. z/OS is providing NAT Traversal support for a defined group of configurations where z/OS is running the IKE daemon. See the information about [IP security in z/OS Communications Server: IP Configuration Guide](#) for a description of the supported configurations and interoperability considerations.

System action

The SA negotiation continues.

Operator response

If the SA negotiation fails or if data cannot be successfully sent over the SA, contact the system programmer.

System programmer response

Determine whether there is an interoperability concern that caused the SA negotiation or data to fail. See the information about [IP security in z/OS Communications Server: IP Configuration Guide](#) for a description of the supported configurations and interoperability considerations.

A possible solution is to use transport-mode IpDataOffers. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

Module

oakley_phaseII.cpp

Procedure name

None.

EZD1105I**IKE detected a NAT while initiating a new dynamic tunnel using both tunnel and transport mode IpDataOffers with a non-z/OS peer****Explanation**

The Internet Key Exchange (IKE) daemon is attempting to initiate a phase 2 Security Association (SA) for a new dynamic tunnel with a non-z/OS peer. The SA traverses a NAT. Both tunnel-mode and transport-mode IpDataOffers are proposed. If the peer selects a tunnel-mode proposal, interoperability issues might exist with the non-z/OS peer. z/OS is providing NAT Traversal support for a defined group of configurations where z/OS is running the IKE daemon. See the information about [IP security in z/OS Communications Server: IP Configuration Guide](#) for a description of the supported configurations and interoperability considerations.

System action

The SA negotiation continues.

Operator response

If the SA negotiation fails or if data cannot be successfully sent over the SA, contact the system programmer.

System programmer response

If the SA negotiation fails or if data cannot be successfully sent over the SA, see the information about [IP security in z/OS Communications Server: IP Configuration Guide](#) to determine if there is an interoperability concern that caused the SA negotiation or data to fail. Contact the remote peer's administrator to understand any interoperability considerations for the non-z/OS platform.

Module

oakley_phaseII.cpp

Procedure name

None.

EZD1106I	Tentative KeyExchangeRule (<i>tentativeKER</i>) and final KeyExchangeRule (<i>finalKER</i>) preshared keys do not match
-----------------	--

Explanation

When using HowToAuthPeers PresharedKey, the SharedKey parameters on the tentative and final KeyExchangeRule statements must match. The initial KeyExchangeRule statement is found by matching on local and remote IP addresses, while the final match also takes the remote ID into account.

In the message text:

tentativeKER

The initial KeyExchangeRule statement that was found by matching only IP addresses

finalKER

The final KeyExchangeRule statement that was found by matching IP addresses and the remote ID

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Change the policy configuration so the final rule will be matched tentatively and finally. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

Module

doi.cpp

Procedure name

None.

EZD1107I	IKE detected a NAT while initiating a narrow Security Association negotiation for a new dynamic tunnel with a non-z/OS peer
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon is attempting to initiate a narrow phase 2 Security Association (SA) for a new dynamic tunnel with a non-z/OS peer. The SA traverses a NAT. A narrow SA is an SA negotiated for specific

ports, protocol, or both. Interoperability issues might exist with the non-z/OS peer when z/OS initiates a narrow phase 2 SA. z/OS is providing NAT Traversal support for a defined group of configurations where z/OS is running the IKE daemon. See the information about [IP security in z/OS Communications Server: IP Configuration Guide](#) for a description of the supported configurations.

System action

The SA negotiation continues.

Operator response

If the SA negotiation fails, contact the system programmer.

System programmer response

If the SA negotiation fails, see the information about [IP security in z/OS Communications Server: IP Configuration Guide](#) to determine if there is an interoperability concern that caused the phase 2 SA negotiation to fail. Contact the remote peer's administrator to understand any interoperability considerations for the non-z/OS platform.

Module

oakley_phaseII.cpp

Procedure name

None.

EZD1108I	Unable to retransmit message - associated phase 1 security association has expired
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon attempted to retransmit a message using a phase 1 security association (SA) that is expired. This might occur in a NAT environment when the IP address of the remote security endpoint is remapped.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages.

System action

The message was not retransmitted and the SA negotiation failed; the IKE daemon continues.

Operator response

Verify that the required tunnels are activated, and if necessary, activate or refresh any required tunnels using the **ipsec** command. See the information about the [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

System programmer response

None.

Module

retrans.cpp

Procedure name

EZD1110I

**An IPv6 address was configured in an IP Security policy file for
stackname that was not configured with IPCONFIG6 IPSECURITY**

Explanation

The Internet Key Exchange (IKE) daemon attempted to retrieve an IpFilterRule from the specified stack. An IPv6 address was configured in an IP Security policy file, but this stack does not have IPCONFIG6 IPSECURITY configured.

In the message text:

stackname

The name of the TCP/IP stack.

System action

The request to retrieve the IpFilterRule fails; the IKE daemon continues.

Operator response

Contact the system programmer to determine whether the specified stack is intended to have IPCONFIG6 IPSECURITY configured.

System programmer response

If you want IPCONFIG6 IPSECURITY to be enabled for the specified stack, update the TCP/IP profile accordingly. Otherwise, correct the IP Security Policy file.

See the information about the [IPCONFIG6](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about specifying IP security for a stack.

See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

EZD1113I	A delete message is being sent with LocalIp ANY for phase 1 security association <i>p1sa_id</i> (LocalIp : <i>local_ip</i> RemoteIp : <i>remote_ip</i>)
-----------------	--

Explanation

A delete message is being sent to the IKE peer to terminate the phase 1 Security Association identified by the *p1sa_id* value between the local IP address specified by the *local_ip* value and the remote IP address specified by the *remote_ip* value. However, the local stack has already deleted its end of the tunnel. To insure that the delete message can be sent, the *local_ip* value is set to the value ANY (`INADDR_ANY` for IPv4 or `IN6ADDR_ANY` for IPv6).

In the message text:

p1sa_id
The phase 1 SA ID.

local_ip
The local IP address.

remote_ip
The remote IP address.

System action

The IKE daemon continues.

Operator response

With a source address value ANY, it is possible that the IKE peer might not handle the delete message. Some IKE implementations might require the source IP address as part of the tunnel identification process. If this message was received after the manual deletion of a DVIPA address, then use the **ipsec** command to deactivate tunnels that involve DVIPA addresses prior to manually deleting the DVIPA.

See the information about the [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

EZD1114I	Policy mismatch : <i>statement state_num</i> requires parameter <i>parameter</i> that is not supported by proposal <i>prop_num</i>
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon was unable to accept a proposal because there was a mismatch in the configured policy. The IKE daemon continues to the next proposal. If no proposals are accepted, the Security Association negotiation will fail. This will be indicated by an EZD0985I, EZD1021I, or EZD1022I message later in syslog.

In the message text:

statement

Indicates whether the mismatched parameter was configured on the KeyExchangeOffer, IpDataOffer, or IpDynVpnAction statement in the policy configuration file.

When configured with the IBM Configuration Assistant for z/OS Communications Server:

- The KeyExchangeOffer statements are located on the corresponding connectivity rule's Advanced IPsec: Dynamic Tunnels: Key Exchange Settings panel. Use the KeyExchangeRule name from message EZD1021I to identify the connectivity rule. The IpDataOffer statement is located in the corresponding security level. However, if the parameter is HowToEncap, this setting is located on the connectivity rule's Advanced IPsec: Dynamic Tunnels: Key Exchange Settings panel. Use the DynVpnAction name from message EZD1022I to identify the security level. Use the IpFilerRule name from message EZD1022I to identify the connectivity rule.
- The IpDynVpnAction statement corresponds to the security level in the IBM Configuration Assistant for z/OS Communications Server. Use the DynVpnAction name from message EZD1022I to identify the corresponding security level.

state_num

The number of a statement referenced from the policy. The number corresponds to the order of the references in the policy. Therefore, the first statement referenced from the policy would have number 1 in this message.

parameter

The parameter that encountered a mismatch. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about the parameter specified.

prop_num

The number of the proposal that is being compared. The number corresponds to the order of proposals in an offer received.

System action

If the IKE daemon does not accept any of the proposals, the negotiation fails; the IKE daemon continues.

System programmer response

If the proposal that contains the mismatch is the one that should be accepted, either alter the local policy to accept the value in this proposal or notify the administrator of the remote security endpoint about the mismatch and ask the administrator to alter the remote configuration to propose the correct values. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

User response

Contact the system programmer.

Module

policy.cpp

Procedure name

EZD1115I

Policy mismatch : Proposal *prop_num* requires parameter *parameter* that is not supported by statement *state_num*

Explanation

The Internet Key Exchange (IKE) daemon was unable to accept a proposal because there was a mismatch in the configured policy. The IKE daemon continues to the next proposal. If no proposals are accepted, the Security Association negotiation will fail. This will be indicated by an EZD0985I, EZD1021I, or EZD1022I message later in syslog.

In the message text:

prop_num

The number of the proposal that is being compared. The number corresponds to the order of proposals in an offer received.

parameter

The parameter that encountered a mismatch. See the information about the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about the parameter specified.

statement

Indicates whether the mismatched parameter was configured on the KeyExchangeOffer, IpDataOffer, or IpDynVpnAction statement in the policy configuration file.

When configured with the IBM Configuration Assistant for z/OS Communications Server:

- The KeyExchangeOffer statements are located on the corresponding connectivity rule's Advanced IPsec: Dynamic Tunnels: Key Exchange Settings panel. Use the KeyExchangeRule name from message EZD1021I

to identify the connectivity rule. The IpDataOffer statement is located in the corresponding security level. However, if the parameter is HowToEncap, this setting is located on the connectivity rule's Advanced IPsec: Dynamic Tunnels: Key Exchange Settings panel. Use the DynVpnAction name from message EZD1022I to identify the security level. Use the IpFilerRule name from message EZD1022I to identify the connectivity rule.

- The IpDynVpnAction statement corresponds to the security level in the IBM Configuration Assistant for z/OS Communications Server. Use the DynVpnAction name from message EZD1022I to identify the corresponding security level.

state_num

The number of a statement referenced from the policy. The number corresponds to the order of the references in the policy. Therefore, the first statement referenced from the policy would have number 1 in this message.

System action

If the IKE daemon does not accept any of the proposals, the negotiation fails; the IKE daemon continues.

System programmer response

If the proposal that contains the mismatch is the one that should be accepted, either alter the local policy to accept the value in this proposal or notify the administrator of the remote security endpoint about the mismatch and ask the administrator to alter the remote configuration to propose the correct values. See the information about the [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

EZD1116I	IKE detected an NAPT in front of the remote security endpoint while initiating a new phase <i>phase</i> tunnel
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon attempted to initiate a new Security Association (SA) with a remote security endpoint that is behind a NAT performing port translation (NAPT). The z/OS IKE daemon cannot initiate such a Security Association but can respond to negotiations with a remote security endpoint behind an NAPT.

A new SA of this configuration type is not supported because there might be problems with future negotiations and traffic flow. See the information about NAT traversal considerations in [z/OS Communications Server: IP Diagnosis Guide](#) for more information. z/OS is providing NAT traversal support for a defined group of configurations where z/OS is running IKE. A description of the supported configurations is provided in [configuration scenarios supported for NAT traversal](#) in [z/OS Communications Server: IP Configuration Guide](#).

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

phase

The phase (1 or 2) that the negotiation was in when the error occurred.

System action

The negotiation fails and all associated SAs are removed; IKE daemon processing continues.

Operator response

The z/OS IKE daemon can respond only to negotiations with a remote security endpoint behind an NAPT. Contact the administrator of the remote security endpoint to initiate the negotiation for this SA.

EZD1118I	Missing required keyword <i>keyword</i> for IKE configuration file parameter <i>pname</i> on line <i>linenum</i>
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon configuration file contains a parameter that requires a keyword that was not found

In the message text:

keyword

The keyword that was not found.

pname

The parameter that requires a keyword.

linenum

The line in the IKE daemon configuration file on which the error was found.

System action

If the error occurs during IKE startup, IKE daemon configuration file processing ends, and the IKE daemon ends. If the error occurs as a result of a MODIFY REFRESH command, IKE daemon configuration file processing ends, but the IKE daemon remains active. IKE configuration retains all values configured prior to the MODIFY REFRESH command.

Operator response

Contact the system programmer.

System programmer response

Specify the required keyword *keyword* and any value that is required for that keyword. See the information about the [IKE daemon](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file and valid parameters for the keyword specified by the *keyword* value.

-----------------	---

Explanation

Line *linenum* of the IKE daemon configuration file *fname* contains a statement *sname* that requires a parameter *pname* that was not found.

In the message text:

pname

The name of the missing parameter.

sname

The name of the statement that requires the parameter.

fname

The name of the IKE daemon configuration file.

linenum

The line in the IKE daemon configuration file on which the error was found.

System action

If the error occurs during IKE startup, IKE daemon configuration file processing ends, and the IKE daemon ends. If the error occurs as a result of a MODIFY REFRESH command, IKE daemon configuration file processing ends, but the IKE daemon remains active. IKE configuration retains all values configured prior to the MODIFY REFRESH command.

Operator response

Contact the system programmer.

System programmer response

Specify the required parameter and any value that is required for that parameter. See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file and valid parameters for the statement specified by the *sname* value.

```

EZD1120I

**IKE configuration file contains more than one IkeConfig statement -
values in last specified statement will be used**

Explanation

The Internet Key Exchange (IKE) daemon configuration file contains more than one instance of the IkeConfig statement. Only one IkeConfig statement per IKE daemon configuration file is supported. The last instance encountered will be used.

System action

The values specified in the last IkeConfig statement are used. The IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

If this message was unexpected, see the information about the [IKE daemon](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file and which statements and parameters are repeatable or non-repeatable.

EZD1121I	IKE configuration file contains more than one NssStackConfig statement for stack <i>sname</i> - values in last specified statement will be used
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon configuration file contains more than one instance of the NssStackConfig statement for the same stack name. The NssStackConfig statement is a repeatable statement, but it is repeatable only for unique stack names.

In the message text:

sname
The name of the stack for which multiple NssStackConfig statements were specified.

System action

The values of the last specified NssStackConfig statement are used for the specified stack; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

If this message was unexpected, see the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file and which statements and parameters are repeatable or non-repeatable.

EZD1122I

Error initializing NMI - monitoring support is not available

Explanation

An error during the startup of the IPsec network management interface (NMI) prevents the IKE daemon from accepting NMI requests.

Additional diagnostic messages that have the same message instance number will be issued to further identify the error. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The IKE daemon continues without NMI support.

Operator response

Not applicable.

System programmer response

If NMI support is needed, fix the underlying problem as indicated by other messages that have the same message instance number and restart the IKE daemon.

User response

Not applicable.

Problem determination

See the system programmer response.

Descriptor code

12

Example

```
EZD1124I NMI connection received from user user33 - 10 connections open
```

EZD1125I	SERVAUTH check for user <i>username</i> and profile <i>profile</i> failed during an NMI request
-----------------	--

Explanation

A SERVAUTH check for the specified user failed when the IKE daemon was verifying access to the specified resource profile while processing a Network Management Interface (NMI) request.

In the message text:

username

The user name of the NMI client that issued the request

profile

The SERVAUTH profile being checked for the user for this NMI request.

System action

The NMI request is not processed and the connection remains open; the IKE daemon continues.

Operator response

Not applicable.

System programmer response

If the user should be allowed to access the specified resource, grant READ access to the specified profile in the SERVAUTH class. See the information about the [IPSec network management interface access control](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

User response

failed during an NMI request
```

EZD1126I**Unable to send NMI message because of a memory shortage**

Explanation

The Internet Key Exchange (IKE) daemon is unable to send a network management interface (NMI) message because there is not enough memory to build some of the required internal structures. Message EZD0963I is issued prior to this message to indicate the amount of memory that was being requested when the failure occurred.

System action

The NMI message is not sent and a termination message is sent over the connection on which the request was received. The IKE daemon continues.

Operator response

Free some memory and try the operation again. See the information about the [diagnosing storage abends and storage growth](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for more information about storage problems.

System programmer response

EZD1127I NMI connection from user33 closed - maximum number of NMI connections open
```

EZD1128I

IKE STATUS FOR STACK *stackname* IS ACTIVE WITHOUT POLICY

Explanation

The Internet Key Exchange (IKE) daemon detected a status change for the specified stack. The IKE daemon can establish Security Associations only after message EZD1058I has been issued for a given stack. The IKE daemon can provide Network Monitoring Interface (NMI) support for a stack after message EZD1128I or message EZD1058I has been issued for a given stack. The IKE daemon might detect a stack status change for several reasons, such as encountering an NssStackConfig statement in the IkeConfig file. See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about the NssStackConfig statement.

In the message text:

stackname

The name of the stack for which a status change has been detected.

System action

The IKE daemon continues.

Operator response

None.

System programmer response

None.

User response

Not applicable.

Problem determination

Not applicable.

Source

z/OS Communications Server TCP/IP: IKE daemon

EZD1130I

A response_type response message with correlator ID corr_id from the NSS server was discarded because a matching request was not found

Explanation

The Internet Key Exchange (IKE) daemon could not match the received response from the network security services (NSS) server with a corresponding request.

In the message text:

response_type

The type of response received from the NSS server.

corr_id

The 16-byte message correlator contained in the response message.

System action

The response message is discarded; the IKE daemon continues.

Operator response

No action needed.

System programmer response

One reason that this message might be issued is that the associated Security Association might have been deleted prior to receiving the response. If this was unexpected, See the information about [diagnosing IP security problems in z/OS Communications Server: IP Diagnosis Guide](#) for information about resolving connectivity problems.

User response

Contact the system programmer.

Problem determination

Not applicable.

ID 0x0123456789ABCDEF from the Network Security Server was discarded
because a matching request was not found
```

EZD1131I

The IKE daemon will not connect to the NSS server for *stackname* because the stack is not configured with IPSECURITY support

Explanation

The iked.conf file has an NssStackConfig statement specified for this stack, but the stack is not configured with IPSECURITY support. The Internet Key Exchange (IKE) daemon connects to only the Network Security Services (NSS) server for stacks that are configured with IPSECURITY support.

In the message text:

stackname

The TCP/IP stack that is specified on the NssStack Config parameter in the iked.conf file.

System action

The IKE daemon does not connect to the NSS server for this stack. The IKE daemon continues.

Operator response

Notify the system programmer.

System programmer response

If this stack should connect to the NSS server, check the stack profile to ensure that IPSECURITY is configured correctly. If this stack should not connect to the NSS server, comment out the NssStackConfig parameter and its associated values from the iked.conf file to avoid seeing this message. See the information about [IPCONFIG statement in z/OS Communications Server: IP Configuration Reference](#) for more information about specifying IPSECURITY for a stack.

configured with IPSECURITY support
```

EZD1132I

***A request_type request for the NSScertificate services could not be sent
for stack stack_name - return code = ret_code***

Explanation

The Internet Key Exchange (IKE) daemon could not send a network certificate services request to the network security services (NSS) server.

In the message text:

request_type

The type of request.

stack_name

The name of the stack.

ret_code

Possible values are:

-1

The IKE daemon is not connected to the NSS server.

-2

The stack is not configured to use network security certificate services.

-3

The stack is not authorized to use network security certificate services.

System action

The request fails; the IKE daemon continues.

Operator response

No action needed.

System programmer response

If the return code indicates that the IKE daemon is not connected to the NSS server, See the information about the [diagnosing network connectivity problems in z/OS Communications Server: IP Diagnosis Guide](#) for information about resolving connectivity problems. If the return code indicates that the stack is not authorized to use network security certificate services, notify the system programmer of the NSS server to provide authorization to the stack for network security certificate services. See the information about IP security in [z/OS Communications Server: IP Configuration Guide](#) for information about network security certificate services.

User response

If the return code indicates that the stack is not configured to use network security certificate services, see the information about IP security in [z/OS Communications Server: IP Configuration Guide](#) for information about configuring network security services. Contact the system programmer for all other return codes.

Problem determination

Not applicable.

EZD1132I A verify signature request for network security certificate services could not be  
sent for stack TCPCS - return code -1
```

EZD1133I

**IKE STATUS FOR STACK *stackname* IS ACTIVE WITHOUT IPSECURITY
SUPPORT**

Explanation

The Internet Key Exchange (IKE) daemon detected that the specified stack is active but is not configured with IP security support. The IKE daemon can establish Security Associations for the specified stack only after that stack has specified the IPCONFIG IPSECURITY option in its configuration profile. See the information about the IPCONFIG statement in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IPSECURITY parameter.

In the message text:

stackname

The name of the stack that is active without IP security support.

System action

The IKE daemon continues.

Operator response

None.

System programmer response

If you want IP security support, specify the IPCONFIG IPSECURITY option in the configuration profile of the stack. See the information about the IPCONFIG statement in [z/OS Communications Server: IP Configuration Reference](#) for more information about the IPSECURITY parameter.

```

EZD1137I**The IKE daemon is disconnected from the NSS server at *location* port *port* for stack *stackname***

Explanation

A connection from the Internet Key Exchange (IKE) daemon to the network security services (NSS) server has been disconnected.

In the message text:

location

The configured hostname or IP address of the NSS server.

port

The port of the NSS server.

stackname

The name of the stack for which the IKE daemon does not have an established connection to the NSS server.

System action

Network security services are not available for the specified stack; the IKE daemon continues.

Operator response

This message is issued only after message EZD1136I has been issued. The following are examples of when this message is issued:

- During IKE daemon shutdown.
- The NSS server is stopped while the IKE daemon is active.
- The IKE daemon configuration file is refreshed following deletion of the NetworkSecurityServer[Backup] statement or deletion of the NssStackConfig statement for the specified stack.

If this message is issued under any other circumstances, notify the system programmer.

EZD1139I

Request type *requestcode* with correlator ID *corrid* for stack *stackname* failed - return code *returncode* reason code *reasoncode*

Explanation

The Internet Key Exchange (IKE) daemon sent a network security services request to the network security services (NSS) server and the server sent a response indicating that the request failed.

In the message text:

requestcode

The NMsMType field of the response.

Possible values are:

- NSS_CreateSignatureReqToSrv
- NSS_VerifySignatureReqToSrv
- NSS_ConnectClientReqToSrv
- NSS_ReadCaCacheReqToSrv
- NSS_UpdateClientStateReqToClient
- NSS_UpdateClientInfoReqToSrv

corrid

A unique identifier for the request.

stackname

The stack for which the request was made.

returncode

The NMsMRc field of the response

reasoncode

The NMsMRsn field of the response.

System action

The request fails; the IKE daemon continues.

Operator response

Save the IKED syslogd log file and contact the system programmer.

System programmer response

See the information about the [Error codes in z/OS Communications Server: IP Diagnosis Guide](#) to determine the appropriate response.

If the *requestcode* is NSS_VerifySignatureReqToSrv and the *returncode* is EGSKVAL, check the log for message EZD2055I that provides additional information on the verification failure, including identification of the failing certificate. If needed, activate IkeSyslogLevel 4 to get DEBUGSA messages that identify the chain of certificates used in the failed verification.

See the [IkeConfig statement in z/OS Communications Server: IP Configuration Reference](#) for information about setting the IkeSyslogLevel.

for stack TCPIP failed - return code EGSKVAL reason code CMSERR_SELF_SIGNED_NOT_FOUND
```

EZD1140I

The NSS server identity is not valid

Explanation

The subject name or one of the subject alternate names in the certificate used by the network security services (NSS) server must match the Identity parameter on either the NetworkSecurityServer keyword or the NetworkSecurityServerBackup keyword of the IkeConfig statement.

The Internet Key Exchange (IKE) daemon will not use network security services and will not be available for remote management until the condition is resolved.

System action

The IKE daemon will periodically try to connect to the server specified by the NetworkSecurityServer keyword and the server specified by the NetworkSecurityServerBackup keyword as configured using the NssWaitLimit and NssWaitRetries keywords of the IkeConfig statement. See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about these keywords.

Operator response

Contact the system programmer.

System programmer response

Check the NetworkSecurityServer keyword or the NetworkSecurityBackup keyword of the IkeConfig statement. See the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for more information about these keywords. If these keywords are configured correctly, check the certificate used by the NSS server. The certificate subject name or one of the certificate subject alternate names must match the configured identity. See the information about the IPsec Certificate management in [z/OS Communications Server: IP Configuration Guide](#) for more information about managing NSS server certificates.

subject
    alternate names in the certificate used by the network security server
EZD1141I The NetworkSecurityServerBackup identity 9.1.2.6 does not match the subject name or any of
the
    subject alternate names in the certificate used by the network security server
EZD1140I The network security server identity is not valid
```

EZD1142I

Name resolution failed for *keyword* hostname *hostname*

Explanation

Name resolution failed for the specified host name on either the NetworkSecurityServer keyword or the NetworkSecurityServerBackup keyword.

In the message text:

keyword

Possible values are NetworkSecurityServer or NetworkSecurityBackup.

hostname

The name that was configured on the host parameter on either the NetworkSecurityServer keyword or the NetworkSecurityServerBackup keyword.

System action

Name resolution fails; the IKE daemon continues. The IKE daemon will not connect to the network security services (NSS) server that corresponds to the specified keyword.

Operator response

Contact the system programmer.

System programmer response

Verify that the host parameter on the NetworkSecurityServer keyword or the NetworkSecurityServerBackup keyword is the correct name. See the information about the [IKE daemon in z/OS Communications Server: IP Configuration Reference](#) for more information about these keywords. See the information about [diagnosing resolver problems](#) information in [z/OS Communications Server: IP Diagnosis Guide](#) for information about resolving name resolution problems. Restart the IKE daemon or issue the MODIFY IKED,REFRESH command

to attempt the name resolution again. See [z/OS Communications Server: IP System Administrator's Commands](#) for more information about the MODIFY command.

In the message text:

stackname

The name of the stack for which the network security remote management service is not available.

System action

The IKE daemon will not support network security remote management for the stack; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

See the information about the network security server authorization considerations in [z/OS Communications Server: IP Configuration Reference](#) for information about authorizing NSS clients.

User response

z/OS Communications Server TCP/IP: IKE daemon

Module

stackobj.cpp

Routing code

10

Descriptor code

12

Example

```
EZD1147I The network security remote management service is not available for stack TCPIP
```

Explanation

The network security server is reachable using only an IPv6 address but the stack does not support IPv6.

In the message text:

stackname

The name of the stack for which the IKE daemon cannot connect to the network security server.

System action

The IKE daemon will not connect to the network security services (NSS) server for the specified stack until the problem is resolved; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

Either reconfigure the stack to support IPv6 or reconfigure the NSS server location using an IPv4 address. For information about reconfiguring the stack to support IPv6, see the information about the [Enabling IPv6 support](#) in *z/OS Communications Server: IPv6 Network and Appl Design Guide*.

For information about configuring the network security server location, use the host parameter of the NetworkSecurityServer and NetworkSecurityServerBackup keywords. See the information about the [IKE daemon](#) information in *z/OS Communications Server: IP Configuration Reference* for more information about these keywords. If the host parameter on either the NetworkSecurityServer or the NetworkSecurityServerBackup keywords indicates a hostname, reconfigure the domain name server so that at least one IPv4 address is resolved for the hostname. See the information about the [diagnosing resolver problems](#) in *z/OS Communications Server: IP Diagnosis Guide* for information about resolving name resolution problems. Restart the IKE daemon or issue the MODIFY IKED,REFRESH command to attempt the name resolution again. See the information about the [MODIFY command](#) in *z/OS Communications Server: IP System Administrator's Commands* for more information.

EZD1149I

The IKE daemon connection to the NSS server at *ipaddr* port *port* for stack *stackname* is not secure

Explanation

The Internet Key Exchange (IKE) daemon connection to the network security server is not secure. The connection to the network security server must be secured using Application Transparent Transport Layer Security (AT-TLS).

In the message text:

ipaddr

The IP address of the network security server.

port

The port of the network security server

stackname

The name of the stack for which the IKE daemon connection to the network security server is not secure.

System action

Network security services are not available for the specified stack; the IKE daemon continues. The IKE daemon will attempt to connect to the NetworkSecurityServer and the NetworkSecurityServerBackup in a round-robin fashion until a secure connection is established. See the information about the [IKE daemon](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about these keywords.

Operator response

Notify the system programmer.

System programmer response

See the information about configuring the IKE daemon information in [z/OS Communications Server: IP Configuration Guide](#) for information about defining AT-TLS policy to protect communication with a network security server.

for stack TCPCS is not secure
```

EZD1150I

**THE IKE DAEMON FAILED TO CONNECT *retries* TIMES TO THE
server_type NSS SERVER AT *host* PORT *port* FOR STACK *stackname***

Explanation

The Internet Key Exchange (IKE) daemon was unable to establish a connection to the Network Security Services (NSS) server for the stack, host, and port specified for the number of retries specified on the NssWaitRetries parameter of the iked.conf file.

In the message text:

retries

The number of retries attempted.

server_type

The type of NSS server for which a connection was not established. Possible values are:

PRIMARY

Primary NSS server

BACKUP

Backup NSS server

host

The configured hostname or IP address for which the connection to the NSS server was not established.

port

The port for which the connection to the NSS server was not established.

stackname

The name of the TCP/IP stack for which the connection to the NSS server was not established.

System action

IKED continues trying to connect to the NSS server by doing one of the following:

- Switching servers, if both a primary and a backup NSS server have been specified in the iked.conf file.
- Trying to connect to the same server, if only a primary or a backup NSS server has been specified in the iked.conf file.

The IKE daemon continues.

Operator response

If connectivity cannot be established, notify the system programmer.

System programmer response

Ensure that the NetworkSecurityServer and NetworkSecurityServerBackup parameters in the iked.conf file have been configured correctly. See the information about the [IKE daemon in z/OS Communications Server: IP Configuration Reference](#) for more information about these keywords. If these keywords are configured correctly, ensure the TCP/IP configuration is specified correctly.

12

Example

```
EZD1150I THE IKE DAEMON FAILED TO CONNECT 4 TIMES TO THE PRIMARY NSS SERVER  
AT 2.5.2.6 PORT 4159 FOR STACK TCPCS4
```

EZD1151I

KeyExchangeAction *actionname* prevents the creation of a dynamic tunnel with source data endpoint specification *source_ip* and destination data endpoint specification *dest_ip*

Explanation

Dynamic tunnel activation is denied as a result of a configured source or destination data IP address constraint. See the information about the [KeyExchangeAction](#) in [z/OS Communications Server: IP Configuration Reference](#) for an explanation of data address constraints.

In the message text:

actionname

The name of the KeyExchangeAction statement configured with a source or destination IP address constraint.

source_ip

The source IP address of the dynamic tunnel.

dest_ip

The destination IP address of the dynamic tunnel.

System action

The dynamic tunnel activation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

If the tunnel activation should be permitted, then do one of the following to correct the configuration.

- When IPSec policy is configured with the IBM Configuration Assistant for z/OS Communications Server, add a connectivity rule with a local data endpoint that matches the *source_ip* value and a remote data endpoint that matches the *dest_ip* value at the top of the rule list.
- When IPSec policy is configured without the IBM Configuration Assistant for z/OS Communications Server, update the KeyExchangeAction ConstrainSource or ConstrainDest configuration to include the *source_ip* value and the *dest_ip* value. See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

If the tunnel activation should not be permitted, then determine whether the tunnel was activated locally or remotely. If the *source_ip* value matches the IP address value in the Local IPSec Client ID information from the Security Association (SA) Context Information that was output with the message, then the tunnel was activated locally. Otherwise, the tunnel was activated remotely. If the tunnel was activated locally but should not be permitted, then correct the local IpFilterPolicy statement to block the activation. See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring the IpFilterPolicy statement. If the tunnel was activated remotely but should not be permitted, then contact the owner of the remote system to request that the activation be blocked on that system.

EZD1152I**The IKE daemon is resolving *server* hostname *name*****Explanation**

The Internet Key Exchange (IKE) daemon is resolving a server hostname. The IKE daemon must resolve the hostname before it can connect to the Network Security Services (NSS) server. No information is exchanged with the NSS server while name resolution is in progress. Message EZD1153I is issued when the name resolution completes.

In the message text:

server

The *server* value can be either NetworkSecurityServer or NetworkSecurityServerBackup.

name

The host name being resolved.

System action

The IKE daemon continues.

Operator response

If the EZD1152I message is not followed by an EZD1153I message it might indicate a problem with the resolver. Contact the system programmer.

System programmer response

If the EZD1152I message is not followed by an EZD1153I message then ensure that the resolver is operating correctly. See the information about [diagnosing resolver problems](#) information in [z/OS Communications Server: IP Diagnosis Guide](#) for more information.

EZD1153I The IKE daemon resolved the NetworkSecurityServer hostname mvs073 to 3 addresses
```

EZD1154I	The remote data endpoint <i>rip</i> with identity <i>rid</i> does not match the remote security endpoint <i>rsip</i> using KeyExchangeAction <i>actionname</i>
-----------------	---

Explanation

When the FilterByIdentity Yes parameter is configured on a KeyExchangeAction statement or a mobile user connectivity rule is configured using the IBM Configuration Assistant for z/OS Communications Server, the peer is restricted to negotiating data protection only for its security endpoint address. Remote identity support is intended for mobile users, who are not permitted to function as a security gateway. However, the peer's data endpoint and security endpoint do not match, which violates the local restriction for mobile user negotiations. It is likely that the peer is not a mobile user; initiation is denied.

In the message text:

rip

The data endpoint IP address of the peer.

rid

The identity of the peer.

rsip

The security endpoint IP address of the peer.

actionname

The name of the KeyExchangeAction statement configured with FilterByIdentity Yes.

System action

The dynamic tunnel activation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

If the peer at the security endpoint IP address should be permitted to function as a security gateway, then correct the local configuration. It is also possible that the peer is a mobile user but is configured in violation of the local restriction for mobile user negotiations. Contact the owner of the peer to determine whether the peer is a mobile user. If so, inform the owner that the peer data endpoint IP address must be configured to match the peer security endpoint IP address when initiating a dynamic tunnel to the z/OS IKE daemon.

When IPSec policy is configured without the IBM Configuration Assistant for z/OS Communications Server, either update the KeyExchange action identified in the message to specify the FilterByIdentity N parameter or configure a new dynamic tunnel that is specific to the initiating peer. See the information about [configuring the branch office model in z/OS Communications Server: IP Configuration Guide](#).

When IPSec policy is configured with the IBM Configuration Assistant for z/OS Communications Server, either edit the mobile user rule and change it to a typical rule, or create a new typical connectivity rule that is specific to the initiating peer and move the new rule above the mobile user rule. See the online helps in the GUI for additional information.

EZD1155I

***t_name* transform *t_num* in proposal *p_num* does not include an integrity algorithm**

Explanation

The Internet Key Exchange (IKE) daemon received a proposal that contains a transform with no encryption algorithm and no integrity algorithm during a dynamic tunnel negotiation. Such a proposal is not permitted and is an auditable event. If no acceptable proposal is received then EZD1022I will also be issued.

In the message text:

t_name

The transform name.

t_num

The transform number. There might be multiple transforms in a proposal.

p_num

The proposal number. There might be multiple proposals in a Security Association (SA) establishment message.

System action

If the IKE daemon does not accept any of the proposals, the negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Use the remote IPSec IP information in the SA context information to identify the source of the invalid proposal. Contact the owner of the invalid proposal and request that the configuration be corrected.

EZD1156I

Extraneous text ignored on line *linenum* after *keyword value*

Explanation

The Internet Key Exchange (IKE) daemon encountered extraneous text in a configuration file. The extraneous text appeared after a keyword and value specification.

In the message text:

linenum

The line of the configuration file where the extraneous text was found

keyword

The configuration keyword after which the extraneous text was found

value

The configuration value after which the extraneous text was found

System action

The configuration keyword is processed, and the extraneous text is ignored. IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Remove the extraneous text from the indicated line in the IKE configuration file. See the information about the [IKE daemon in z/OS Communications Server: IP Configuration Reference](#) for more information about the IKE daemon configuration file syntax.

EZD1157I	IKE message received from <i>remote_ip</i> port <i>remote_port</i> to <i>local_ip</i> port <i>local_port</i> with length <i>message_length</i> is too short to contain the IKE header
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon received a message that is too short to contain the message header, which is 28 bytes long.

In the message text:

remote_ip

The remote security endpoint IP specification.

remote_port

The remote port of the IKE daemon peer.

local_ip

The local security endpoint IP specification.

local_port

The local port of the IKE daemon.

message_length

The length of the IKE message, in bytes.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that a protocol error has occurred.

```
EZD1158I DISPLAY IKE CONFIGURATION:
```

EZD1159I	Remote security endpoint <i>id_type</i> identity length <i>id_length</i> is longer than the maximum of <i>id_max</i>
-----------------	---

Explanation

An IKE Security Association (SA) negotiation failed because the remote security endpoint identity received that was from the IKE peer was longer than the maximum allowed.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

id_type

The name of the remote security endpoint identity type

id_length

The length of the remote security endpoint identity received from the IKE peer.

id_max

The maximum acceptable length for a remote security endpoint identity.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint and ask the administrator to configure the remote security endpoint with a smaller identity or a different identity type.

User response

Not applicable.

Problem determination

EZD1160I

Policy mismatch: IpDynVpnAction *statement_name* requires parameter *parameter_name* with value *policy_value* but the value selected by the IKE peer is *peer_value*

Explanation

The Internet Key Exchange (IKE) daemon was unable to accept a value selected by the IKE peer because the value is not allowed by the local policy. The Security Association negotiation will fail. Message EZD1022I will be issued to syslog and will indicate the failure.

In the message text:

statement_name

- In the policy agent configuration file, the *statement_name* value is the name specified on the applicable IpDynVpnAction statement.
- If the policy agent is configured with the IBM Configuration Assistant for z/OS Communications Server, the *statement_name* value corresponds to the name of the security level in the GUI. The value also contains a numeric suffix appended to the security level name to guarantee uniqueness.

parameter_name

The IpDynVpnAction parameter that encountered a mismatch. See the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about the parameter specified.

policy_value

The IpDynVpnAction parameter value that does not match the value selected by the IKE peer.

peer_value

The value selected by the IKE peer that does not match the *policy_value* value.

System action

The negotiation fails; the IKE daemon continues.

Operator response

Notify the system programmer.

System programmer response

Ensure that the IpDynVpnAction statement is configured correctly. Alter either the local policy to accept the value specified by *peer_value* in this statement or notify the administrator of the remote security endpoint about the mismatch and ask the administrator to alter the remote configuration to propose the *policy_value* value required by the local policy. See the [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

EZD1161I**DCAS CONFIGURATION SERVERTYPE IS UNDEFINED**

Explanation

The combination of SERVERTYPE keyword definitions in the DCAS configuration file caused the SERVERTYPE keyword to be undefined to DCAS.

System action

DCAS ends.

Operator response

Contact the system programmer.

System programmer response

See [z/OS Communications Server: IP Configuration Reference](#) for a list of the SERVERTYPE keyword values in the DCAS configuration file.

Module

dcasconf.c

Procedure name

process_config_keyword()

EZD1162I	DCAS CONFIGURATION SERVERTYPE <i>value</i> IS NOT SUPPORTED
-----------------	--

Explanation

This message is issued when DCAS is processing the DCAS configuration file.
value is the SERVERTYPE keyword that is not supported.

System action

DCAS ends.

Operator response

Contact the system programmer.

System programmer response

See [z/OS Communications Server: IP Configuration Reference](#) for a list of the SERVERTYPE keyword values in the DCAS configuration file.

Module

dcasconf.c

Procedure name

process_config_keyword()

EZD1163I	<i>ip_version</i> DYNAMIC XCF INTERFACE <i>xcfinterface_name</i> WAS CREATED BUT THE SPECIFIED SOURCEVIPAINTERFACE <i>interface_name</i> WILL NOT BE USED
-----------------	--

Explanation

The interface name specified by the SOURCEVIPAINTERFACE parameter on the IPCONFIG DYNAMICXCF statement or the IPCONFIG6 DYNAMICXCF statement was not valid. The interface name must be an active static VIPA link or interface name of the appropriate IP version.

In the message text:

ip_version
Either IPV4 or IPV6

xcfinterface_name

The Dynamic XCF interface name that was created

interface_name

The name that was specified on the SOURCEVIPAINTERFACE parameter for IPCONFIG DYNAMICXCF or IPCONFIG6 DYNAMICXCF

System action

The dynamic XCF interface is created. TCP/IP continues.

Operator response

Contact the system programmer.

System programmer response

Create a static VIPA with an interface name that matches the one specified on the IPCONFIG DYNAMICXCF or IPCONFIG6 DYNAMICXCF SOURCEVIPAINTERFACE statement and restart TCP/IP.

WILL NOT BE USED
```

EZD1164I

**IPV6 TCPSTACKSOURCEVIPAINTERFACE *interface_name* WAS NOT
USED BY *tcp_jobname***

Explanation

An outbound connection request was processed but the interface configured with TCPSTACKSOURCEVIPA could not be used to determine the source IPv6 address because the interface was not an active static VIPA interface or an active dynamic VIPA interface.

interface_name is the name specified on the TCPSTACKSOURCEVIPA parameter of the IPCONFIG6 statement.

tcp_jobname is the name of the job associated with the procedure that was used to start TCP/IP.

System action

TCP/IP continues. To avoid flooding the system console, this informational message will not be issued again for at least five minutes.

Operator response

Contact the system programmer.

System programmer response

Change the TCPSTACKSOURCEVIPA interface name to be an active static or dynamic VIPA interface.

Module

EZBX6UTL

Procedure name

EZBX6SSV

EZD1165I DVIPA INTERFACE *interface_name* IS ALREADY DEFINED WITH *ip_addr*

Explanation

The TCPIP detected that the interface *interface_name* was already defined as a DVIPA interface with a conflicting definition.

For a VIPADEFINE/VIPABACKUP configuration statement, the interface was already defined either by a previous VIPADEFINE/VIPABACKUP with a different IP address, or by a SIOCSVIPA IOCTL or BIND to an IP address in a configured VIPARANGE.

interface_name is the interface name specified on the VIPADEFINE/VIPABACKUP statement.

ip_addr is the IP address specified on the previous VIPADEFINE/VIPABACKUP statement.

System action

Processing continues. The VIPABACKUP or VIPADEFINE statement is rejected.

Operator response

Contact the system programmer.

System programmer response

Correct the VIPABACKUP or VIPADEFINE statement with a different IP address or with a different interface name.

Module

EZBX6DVI

Procedure name

PreValidateVBKUP6, PreValidateVDEF6

EZD1166E	<i>tcpstackname</i> DELAYING SYSPLEX PROFILE PROCESSING - <i>application</i> IS NOT ACTIVE
-----------------	---

Explanation

The TCP/IP stack delayed joining a sysplex group and delayed processing sysplex definitions in the profile (VIPADYNAMIC and IPCONFIG/IPCONFIG6 DYNAMICXCF statements).

tcpstackname is the name of the TCP/IP stack.

application is the name of the application that is not active and is either OMPROUTE or VTAM.

See the information about [sysplex problem detection and recovery](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

System action

TCP/IP continues.

Operator response

If *application* is VTAM, start VTAM.

If the *application* value is OMPROUTE and it is not active, start OMPROUTE; If OMPROUTE is active, contact the system programmer. This message is issued for OMPROUTE only if GLOBALCONFIG SYSPLEXMONITOR DELAYJOIN was specified in a profile.

If you want the TCP/IP stack to immediately join a sysplex group rather than waiting for OMPROUTE to activate, issue the VARY TCPIP,,OBEYFILE command with GLOBALCONFIG SYSPLEXMONITOR NODELAYJOIN specified. See [z/OS Communications Server: IP Configuration Reference](#) for information about the DELAYJOIN keyword.

When OMPROUTE activation is complete or a VARY TCPIP,,OBEYFILE command with GLOBALCONFIG SYSPLEXMONITOR NODELAYJOIN has been specified, TCP/IP will join a sysplex group and finish processing the sysplex definitions.

System programmer response

If VTAM or OMPROUTE cannot be started, contact IBM software support services with the system log.

Module

EZBXFPDM

Procedure name

EZBXFPDM

EZD1167I	DVIPA INTERFACE <i>interface_name</i> IS CONFIGURED FROM A VIPARANGE
-----------------	---

Explanation

The interface name specified on a VIPADELETE was defined on a VIPARANGE statement. The interface cannot be deleted by using a VIPADELETE statement.

interface_name is the interface name specified on the VIPADELETE statement.

System action

Processing continues. The VIPADELETE statement is rejected.

Operator response

Contact the system programmer.

System programmer response

Change the VIPADELETE to specify a valid interface name, or use a VIPARANGE DELETE (instead of a VIPADELETE) to delete the configured VIPARANGE statement.

Module

EZBX6DVI

Procedure name

ValidateVDEL6

EZD1168I	VIPADISTRIBUTE WITH THE PORT KEYWORD REJECTED FOR INTERFACE <i>interface_name</i>
-----------------	--

Explanation

The PORT keyword was specified on a VIPADISTRIBUTE statement for a Dynamic VIPA (DVIPA) that already had a VIPADISTRIBUTE statement specified without a PORT keyword, indicating dynamic ports.

interface_name is the interface name specified on the rejected VIPADISTRIBUTE statement with the PORT keyword.

System action

Processing continues. The VIPADISTRIBUTE statement is rejected.

Operator response

Contact the system programmer.

System programmer response

To disable dynamic ports, delete all previous VIPADISTRIBUTE statements for this DVIPA. Then reissue the VIPADISTRIBUTE with the PORT keyword.

Module

EZBX6DVI

Procedure name

ValidateVDIST6

EZD1169I	VIPADISTRIBUTE WITHOUT THE PORT KEYWORD REJECTED FOR INTERFACE <i>interface_name</i>
-----------------	---

Explanation

The PORT keyword was not specified on a VIPADISTRIBUTE statement indicating dynamic ports for a Dynamic VIPA (DVIPA) that already had a VIPADISTRIBUTE statement specified with a PORT keyword.

interface_name is the interface name specified on the rejected VIPADISTRIBUTE statement without the PORT keyword.

System action

Processing continues. The VIPADISTRIBUTE statement is rejected.

Operator response

Contact the system programmer.

System programmer response

To enable dynamic ports, delete all previous VIPADISTRIBUTE statements for this DVIPA. Then reissue the VIPADISTRIBUTE without the PORT keyword.

Module

EZBX6DVI

Procedure name

ValidateVDIST6

EZD1170E *tcpstackname* WAS NOT ABLE TO GET TCP/IP *storagetype* STORAGE

Explanation

TCP/IP was not able to satisfy a request for storage.

tcpstackname is the name of the TCP/IP stack.

storagetype is the type of storage that was unavailable. The value for *storagetype* is either private or ECSA (Extended Common Storage Area)

System action

TCP/IP continues.

- If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of the TCP/IP sysplex group, the following RECOVERY actions will occur:
 - This stack will leave the TCP/IP sysplex group.
 - This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack will be deactivated; however, the DVIPA definitions will be saved.
 - When the stack leaves the TCP/IP sysplex group, this operator message will be deleted.
- If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action will be taken.

See the information about [sysplex problem detection and recovery](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information. See the information about the [GLOBALCONFIG statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for the definitions of the SYSPLEXMONITOR parameters.

Operator response

Save the TCP/IP profile and system log. If a dump was not created, then take a dump of the TCP/IP address space and dataspace.

If NORECOVERY is active, no further actions are needed.

If RECOVERY is active, then even if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will *not* automatically rejoin the TCP/IP sysplex group, due to the severity of the problem encountered. Message EZZ9676E will be displayed if the TCP/IP stack successfully deactivates all DVIPAs and leaves the TCP/IP sysplex group. After this message is displayed, issuing the VARY TCPIP,,SYSPLEX,JOINGROUP command will cause the DVIPA definitions to be processed, and the stack to rejoin the TCP/IP sysplex group.

System programmer response

Use the display TCP/IP storage command D TCPIP,,STOR to determine the current status of TCP/IP private and ECSA storage. See [z/OS Communications Server: IP System Administrator's Commands](#) for more information about the D TCPIP,,STOR command.

For ECSA storage exhaustion, determine which jobs or address spaces are using an excessive amount of storage. To determine the users of ECSA storage, enable common storage tracking. See the [z/OS MVS Initialization and Tuning Guide](#) for information about requesting common storage tracking. Use the VERBEXIT VSMDATA OWNCOMM SUMMARY command to determine how much storage is used by each job. See the [z/OS MVS Diagnosis: Tools and Service Aids](#) for information about the IPCS VERBEXIT VSMDATA command.

If the storage problem cannot be corrected, contact IBM software support services with all supporting documentation.

If the storage problem can be corrected:

- If RECOVERY is active, then issue the VARY TCPIP,,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed, and the stack to rejoin the TCP/IP sysplex group.

Module

EZBXFPDC

Procedure name

EZBXFPDC

EZD1171I	THERE IS NO ROUTE AVAILABLE FOR VIPAROUTE <i>dxcf_address</i> <i>target_ipaddress</i>
-----------------	--

Explanation

The target stack identified by *dxcf_address* is active, and *target_ipaddress* is defined at that target stack, however no route is available to *target_ipaddress*. As a result, the local stack cannot forward any DVIPA packets to the target stack.

dxcf_address is the dynamic XCF address of a target stack as specified on the VIPAROUTE statement.

target_ipaddress is the IP address in the HOME list of the target stack as specified on the VIPAROUTE statement.

System action

TCP/IP continues, but the local stack cannot forward any DVIPA packets to the target stack.

Operator response

This might be a temporary condition that can resolve itself when the route becomes available. Use the Netstat ROUTE/-r command on the distributing stack to see possible routing failure problems to that target stack. If the problem cannot be resolved, contact the system programmer.

System programmer response

See the information about diagnosing OMPROUTE problems in [z/OS Communications Server: IP Diagnosis Guide](#) for information about routing failures.

Module

EZBXFDVI, EZBX6DVI, EZBXFMS4, EZBX6MS2

Procedure name

EZBXFDVI, EZBX6DVI, EZBXFMS4, EZBX6MS2

EZD1172E

***tcpstackname* DETERMINED THAT ALL PARTNERS WERE
UNREACHABLE FOR AT LEAST *timevalue* SECONDS**

Explanation

Sysplex problem detection determined that there are no routes available to any partners.

tcpstackname is the name of the TCP/IP stack.

timevalue is the number of seconds that connectivity was not available.

System action

TCP/IP continues.

- If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions will occur:
 - This stack will leave the TCP/IP sysplex group.
 - This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack will be deactivated; however, the DVIPA definitions will be saved.
 - If the problem is corrected, this operator message will be deleted; if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will process the DVIPA definitions and rejoin the TCP/IP sysplex group.
- If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action will be taken. If the problem is corrected, this operator message will be deleted.

See the information about [sysplex problem detection and recovery](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

See the information about the [GLOBALCONFIG statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for the definition of the SYSPLEXMONITOR parameters.

Operator response

Contact the system programmer.

System programmer response

Issue Netstat ROUTe/-r to determine which interfaces are used by the VIPAROUTE statements. Issue the Netstat DEvlinks/-d command to show which interfaces are active; check the system log for any messages related to the status of interfaces. If you cannot determine why the routes were lost, see the information about [diagnosing OMPROUTE problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for additional information.

If this problem can be corrected, this operator message will be deleted.

If RECOVERY and NOAUTOREJOIN are active, then issue the VARY TCPIP,,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed, and the stack to rejoin the TCP/IP sysplex group.

If RECOVERY and AUTOREJOIN are active, no further actions are needed. The stack will process the DVIPA definitions and rejoin the TCP/IP sysplex group.

If NORECOVERY is active, no further actions are needed.

After connectivity is reestablished, if RECOVERY is active, wait until message EZD1172E is issued when the process of leaving the sysplex group completes successfully. Then issue the VARY TCPIP,, SYSPLEX,JOINGROUP command to cause the stack to rejoin the sysplex group. If NORECOVERY is active, no further actions are needed.

Module

EZBXFPDM

Procedure name

EZBXFPDM

EZD1173I	VIPAROUTE IS NOT ENABLED FOR <i>dxcf_address</i> <i>target_ipaddress</i> - TARGET IP ADDRESS IS NOT VALID
-----------------	--

Explanation

The target stack identified by *dxcf_address* is active, but *target_ipaddress* is not defined at that target stack or it is defined, but the address is not valid (for example, a dynamic VIPA address or loopback is used). The local stack will forward DVIPA packets to the target stack using dynamic XCF interfaces.

dxcf_address is the dynamic XCF address of a target stack as specified on the VIPAROUTE statement.

target_ipaddress is the IP address as specified on the VIPAROUTE statement.

System action

TCP/IP continues.

Operator response

Contact the system programmer.

System programmer response

Take the following actions to correct the problem:

- Ensure that the VIPAROUTE statement specifies the correct DXCF address and target IP address for the desired target stack.
- Ensure that *target_ipaddress* is correctly defined in the HOME list of the target stack and that it is an address that is valid for use as a target IP address.

See [z/OS Communications Server: IP Configuration Reference](#) for information about the VIPAROUTE statement.

Module

EZD1175I	VARY TCPIP,,SYSPLEX,JOINGROUP COMMAND IGNORED BECAUSE <i>tcpstackname</i> IS ALREADY A MEMBER OF A TCP/IP SYSPLEX GROUP
-----------------	--

Explanation

The command was ignored because the TCP/IP stack is already a member of a TCP/IP sysplex group.

tcpstackname is the name of the TCP/IP stack.

System action

TCP/IP continues.

Operator response

None.

System programmer response

None.

Module

EZBXFIO2

Procedure name

EZBXFSVS

EZD1176I	<i>tcpstackname</i> HAS SUCCESSFULLY JOINED THE TCP/IP SYSPLEX GROUP <i>groupname</i>
-----------------	--

Explanation

The TCP/IP stack successfully joined the TCP/IP sysplex group *groupname*. This stack can participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs.

tcpstackname is the name of the TCP/IP stack.

groupname is the name of the TCP/IP sysplex group that was joined.

Initialization of extended TCP/IP services, such as installation of policies, might not yet be complete. Message ESD1314I is issued when both TCP/IP and extended services are initialized. Message ESD1314I can be used in automation to indicate that the TCP/IP stack is ready for use by applications. See [“ESD1314I” on page 954](#) for more information.

System action

TCP/IP continues.

Operator response

None.

System programmer response

None.

Module

EZBXFINI

Procedure name

Join_Sysplex_Group

ESD1177I	<i>tcpstackname</i> SYSPLEX PROFILE DEFINITIONS ARE IGNORED BECAUSE THE STACK IS NO LONGER A MEMBER OF A TCP/IP SYSPLEX GROUP
-----------------	--

Explanation

The sysplex profile definitions in the data set referenced by the VARY TCPIP,,OBEYFILE command were ignored because the stack is no longer a member of a TCP/IP sysplex group. Sysplex profile definitions cannot be applied if the stack is not a member of a TCP/IP sysplex group.

The stack left the TCP/IP sysplex group because one of the following occurred:

- A VARY TCPIP,,SYSPLEX,LEAVEGROUP command was issued, causing the stack to leave the TCP/IP sysplex group.
- A problem was detected that caused the stack to leave the TCP/IP sysplex group.

tcpstackname is the name of the TCP/IP stack.

System action

TCP/IP continues.

Operator response

If a VARY TCPIP,,SYSPLEX,LEAVEGROUP command was issued, then issue a VARY TCPIP,,SYSPLEX,JOINGROUP command to cause the stack to rejoin the TCP/IP sysplex group. If a problem was detected, prior eventual action messages explain why the stack is not a member. The problem that caused the stack to leave the TCP/IP

sysplex group should be identified and corrected so that the stack can rejoin the TCP/IP sysplex group. See the information about [sysplex problem detection and recovery](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information. If the problem cannot be corrected, contact the system programmer. When the stack has rejoined the TCP/IP sysplex group, the sysplex profile definitions can be reapplied.

System programmer response

If the problem causing the stack to leave the TCP/IP sysplex group cannot be corrected, contact IBM software support services.

Module

EZBXFDYN

EZD1179I	VIPAROUTE DEFINE REJECTED - <i>dxcf_address</i> IS ALREADY DEFINED
-----------------	---

Explanation

The VIPAROUTE DEFINE statement was rejected. The same dynamic XCF address was already defined with a different target IP address on a prior VIPAROUTE DEFINE statement.

dxcf_address is the dynamic XCF address that was specified on the VIPAROUTE DEFINE statement that was rejected.

System action

TCP/IP continues but the VIPAROUTE DEFINE statement is ignored.

Operator response

Contact the system programmer.

System programmer response

Correct the VIPAROUTE statement and issue a VARY TCPIP,,OBEYFILE command with the new VIPADYNAMIC block.

Module

EZBXFDVI, EZBX6DVI

Procedure name

EZBXFDVI, EZBX6DVI

EZD1180I	VIPAROUTE DELETE REJECTED - <i>dxcf_address</i> <i>target_ipaddress</i> IS NOT DEFINED
-----------------	---

Explanation

The VIPAROUTE DELETE statement was rejected. The *dxcf_address* with *target_ipaddress* was not found on a previously defined VIPAROUTE DEFINE statement.

dxcf_address is the dynamic XCF address that was specified on the VIPAROUTE DELETE statement that was rejected.

target_ipaddress is the IP address in the HOME list of the target stack as specified on the VIPAROUTE statement.

System action

TCP/IP continues but the VIPAROUTE DELETE statement is ignored.

Operator response

Contact the system programmer.

System programmer response

Correct the VIPAROUTE DELETE statement and issue a VARY TCPIP,,OBEYFILE command with a new VIPADYNAMIC block.

Module

EZBXFDVI, EZBX6DVI

Procedure name

EZBXFDVI, EZBX6DVI

EZD1181I	VIPAROUTE DEFINE <i>dxcf_address</i> REJECTED - ENTRIES EXCEEDED
-----------------	---

Explanation

The VIPAROUTE DEFINE statement was rejected. The maximum number of 256 VIPAROUTE entries was exceeded.

dxcf_address is the dynamic XCF address that was coded on the VIPAROUTE statement that was rejected.

System action

TCP/IP continues but the VIPAROUTE statement is ignored.

Operator response

Contact the system programmer.

System programmer response

Issue a VARY TCPIP,,OBEYFILE command with a new VIPADYNAMIC block to remove unneeded VIPAROUTE entries before adding new ones.

Procedure name

EZBXFDVI, EZBX6DVI

EZD1182I **TARGET SERVER FOR *dvipa_or_intfname* PORT *portnum* AT *tcp_name* ON *host_name* IS NOT RESPONSIVE - TCSR *tcsr_value* CER *cer_value* SEF *sef_value***

Explanation

The server that is servicing the specified distributed dynamic virtual IP address (DVIPA) and port number became unresponsive while it was processing connection setup requests. The server is no longer successfully processing incoming connection requests.

In the message text:

dvipa_or_intfname

- For IPv4, specifies the distributed DVIPA that is being serviced by the target server.
- For IPv6, specifies the interface name associated with the distributed DVIPA that is being serviced by the target server.

portnum

The port that is being serviced by the target server.

tcp_name

The name of the TCP/IP stack that the target server is using.

host_name

The name of the MVS system that the TCP/IP stack is running on.

tcsr_value

The percent of connection setup requests that are routed from the distributor and that are successfully received by the target for this server.

cer_value

The percentage of connection setup requests that are received by the target for this server and that achieve the connection established state.

sef_value

The server efficiency factor for the server application. This value is an indication of how effectively the application is accepting new connection requests and managing its backlog queue.

System action

Processing continues. New connection setup requests are not routed to this target server until the target server recovers. Message EZD1183I will be issued at that time.

host_name is the name of the MVS system that the TCP/IP stack is running on.

System action

Processing continues. New connection setup requests will now be routed to this target server.

Operator response

None.

System programmer response

None.

EZD1186I	THE VARY TCPIP,,SYSPLEX,DEACTIVATE,DVIPA COMMAND WAS REJECTED BECAUSE THE DVIPA IS NOT DEFINED BY VIPADEFINE OR VIPABACKUP ON THIS STACK
-----------------	---

Explanation

A VARY TCPIP,,SYSPLEX,DEACTIVATE,DVIPA command was issued for a DVIPA. The command was rejected because the DVIPA is not defined by a VIPADEFINE or VIPABACKUP statement on this stack. The VARY

TCP/IP,,SYSPLEX,DEACTIVATE,DVIPA command can be issued only on the stack that has a VIPADEFINE or VIPABACKUP definition for this DVIPA. Use the Netstat VIPADCFG/-F command to see all the currently active DVIPAs and deactivated DVIPAs.

System action

TCP/IP continues.

Operator response

None.

System programmer response

None.

Module

EZBXFIO2

Procedure name

EZBXFSVS

EZD1187E *tcpstackname* WAS NOT ABLE TO GET TCP/IP *storagetype* STORAGE

Explanation

As a result of storage limits set by GLOBALCONFIG, *tcpstackname* was not able to get TCP/IP *storagetype* storage.

tcpstackname is the name of the TCP/IP stack.

storagetype is the type of storage that was unavailable. *storagetype* will be either **PRIVATE** or **ECSA** (extended common storage area).

System action

TCP/IP continues.

- If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions will occur:
 - This stack will leave the TCP/IP sysplex group.
 - This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack will be deleted; however, the DVIPA definitions will be saved.
 - If the problem is corrected, this operator message will be deleted; if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will process the saved DVIPA definitions and rejoin the TCP/IP sysplex group.
- If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action will be taken. If the problem is corrected, this operator message will be deleted.

See the information about sysplex problem detection and recovery in [z/OS Communications Server: IP Configuration Guide](#). See the information about the GLOBALCONFIG statement in [z/OS Communications Server: IP Configuration Reference](#) for the definitions of the SYSPLEXMONITOR parameters.

Operator response

If the storage problem cannot be corrected, save the TCP/IP profile and system log. If a dump was not created, then take a dump of the TCP/IP address space and dataspaces. Contact the system programmer.

System programmer response

Use the display TCP/IP storage command `D TCPIP,,STOR` to determine the current status of TCP/IP PRIVATE and ECSA storage. See the information about the `DISPLAY TCPIP,,STOR` command in [z/OS Communications Server: IP System Administrator's Commands](#) for more information about using this command.

Storage limits were set using the `GLOBALCONFIG ECSALIMIT` or `GLOBALCONFIG POOLLIMIT` statement. It might be necessary to raise these limits to correct this problem; look for earlier TCP/IP warning messages that are issued each time a storage limit boundary is crossed (OK, CONSTRAINED, CRITICAL, and EXHAUSTED).

See the information about the `GLOBALCONFIG` statement in [z/OS Communications Server: IP Configuration Reference](#) for the definitions of the `ECSALIMIT` and `POOLLIMIT`. For ECSA storage exhaustion, it is necessary to determine which jobs or address spaces are using an excessive amount of storage. To determine the users of ECSA storage, common storage tracking should be enabled. See the [z/OS MVS Initialization and Tuning Guide](#) for information about requesting common storage tracking. Use the `VERBEXIT VSMDATA OWNCOMM SUMMARY` command to determine how much storage is used by each job. See the [z/OS MVS Diagnosis: Tools and Service Aids](#) for information about the `IPCS VERBEXIT VSMDATA` command.

If the storage problem cannot be corrected, contact IBM software support services with all supporting documentation.

If this problem can be corrected, this operator message will be deleted.

If `RECOVERY` and `NOAUTOREJOIN` are active, then issue the `VARY TCPIP,,SYSPLEX,JOINGROUP` command to cause the saved DVIPA definitions to be processed, and the stack to rejoin the TCP/IP sysplex group.

If `RECOVERY` and `AUTOREJOIN` are active, no further actions are needed. The stack will process the DVIPA definitions and rejoin the TCP/IP sysplex group.

If `NORECOVERY` is active, no further actions are needed.

EZBXFDYN

EZD1194E	<i>tcpstackname</i> SYSPLEX PROCESSING ENCOUNTERED A NONRECOVERABLE ERROR WHILE TRYING TO RESTORE THE SAVED SYSPLEX CONFIGURATION
-----------------	--

Explanation

A nonrecoverable error was encountered while attempting to restore the saved configuration and join a TCP/IP sysplex group.

tcpstackname is the name of the TCP/IP stack.

System action

TCP/IP continues. The stack must be restarted to join a TCP/IP sysplex group. If AUTOREJOIN was configured, it is now disabled.

Operator response

Save the TCP/IP profile and system log. If a dump was not created, then take a dump of the TCP/IP address space and dataspace. Contact the system programmer.

System programmer response

Contact IBM software support services with the TCP/IP profile, system log and dump.

Module

EZBXFUT4

Procedure name

EZBXFRSC

EZD1195I	THE VARY TCPIP,,SYSPLEX,JOINGROUP COMMAND WAS REJECTED. THE STACK MUST BE RESTARTED TO JOIN A TCP/IP SYSPLEX GROUP
-----------------	---

Explanation

The VARY SYSPLEX,JOINGROUP command was rejected because either sysplex problem detection cleanup failed as the stack left the TCP/IP sysplex group, or a previous attempt to process the saved sysplex configuration and join a TCP/IP sysplex group failed. See the explanation of message EZD1194E (issued if failure occurs while processing the saved sysplex configuration) or EZZ9675E (issued for sysplex cleanup failure) in [z/OS Communications Server: IP Messages Volume 4 \(EZZ, SNM\)](#) for more information.

System action

TCP/IP continues. The stack must be restarted to join a TCP/IP sysplex group.

Operator response

See the explanations of messages EZD1194E or EZZ9675E for more information.

System programmer response

See the explanations of messages EZD1194E or EZZ9775E for more information.

None.

System programmer response

None.

Module

EZBXFUT4

Procedure name

EZBXFVVS

EZD1198I	THE VARY TCPIP,,SYSPLEX,<i>cmdtype</i> COMMAND COMPLETED SUCCESSFULLY
-----------------	--

Explanation

A VARY SYSPLEX QUIESCE or RESUME command completed successfully.

cmdtype is either **QUIESCE** or **RESUME**.

System action

TCP/IP continues.

Operator response

None.

System programmer response

None.

Module

EZBXFUT4

Procedure name

Process_QUIESCE_cmd, Process_RESUME_cmd

EZD1199I	THE VARY TCPIP,,SYSPLEX,<i>cmdtype</i> COMMAND WAS IGNORED BECAUSE NO APPLICATION WAS FOUND LISTENING WITH THE SPECIFIED COMMAND PARAMETERS
-----------------	--

Explanation

A VARY SYSPLEX QUIESCE or RESUME command was issued for a specific port. The command was ignored because no application was found listening with the parameters specified on the command.

cmdtype is either **QUIESCE** or **RESUME**.

System action

TCP/IP continues.

Operator response

Reissue the command after correcting the command parameters. See the information about the [VARY QUIESCE command](#) and the [VARY RESUME command](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for more information.

System programmer response

None.

Module

EZBXFUT4

Procedure name

Process_QUIESCE_cmd, Process_RESUME_cmd

EZD1200I	THE VARY TCPIP,,SYSPLEX,<i>cmdtype</i> COMMAND WAS REJECTED BECAUSE MORE THAN ONE LISTENING APPLICATION WAS FOUND MATCHING THE COMMAND PARAMETERS
-----------------	--

Explanation

A VARY SYSPLEX QUIESCE or RESUME command was issued for a specific port. The command was rejected because there is more than one listening application matching the parameters specified on the command.

cmdtype is either **QUIESCE** or **RESUME**.

System action

TCP/IP continues.

Operator response

You must specify the JOBNAME and possibly the ASID parameters to identify a unique listening application. See the information about the [VARY QUIESCE command](#) and the [VARY RESUME command](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for more information.

System programmer response

None.

Module

EZBXFUT4

Procedure name

Process_QUIESCE_cmd, Process_RESUME_cmd

EZD1201I	THE VARY TCPIP,,SYSPLEX,RESUME,PORT COMMAND WAS REJECTED BECAUSE IT FOLLOWS A VARY TCPIP,,SYSPLEX,QUIESCE,TARGET COMMAND
-----------------	---

Explanation

A VARY TCPIP,,SYSPLEX,RESUME,PORT command cannot follow a VARY TCPIP,,SYSPLEX,QUIESCE,TARGET command. The only valid RESUME command that can follow a VARY TCPIP,,SYSPLEX,QUIESCE,TARGET is VARY TCPIP,,SYSPLEX,RESUME,TARGET.

System action

TCP/IP continues.

Operator response

You must specify VARY TCPIP,,SYSPLEX,RESUME,TARGET to resume the listening applications for DVIPA sysplex distributor workload distribution following a VARY TCPIP,,SYSPLEX,QUIESCE,TARGET command.

System programmer response

None.

Module

EZBXFUT4

Procedure name

Process_RESUME_cmd

EZD1202I**THE VARY TCPIP,,SYSPLEX,RESUME,TARGET COMMAND WAS
REJECTED BECAUSE IT WAS NOT PRECEDED BY A CORRESPONDING
VARY TCPIP,,SYSPLEX,QUIESCE,TARGET COMMAND**

Explanation

A VARY TCPIP,,SYSPLEX,RESUME,TARGET command can only follow a VARY TCPIP,,SYSPLEX,QUIESCE,TARGET command.

System action

TCP/IP continues.

Operator response

You must specify VARY TCPIP,,SYSPLEX,RESUME,PORT to resume a listening application for DVIPA sysplex distributor workload distribution that has been previously quiesced using VARY TCPIP,,SYSPLEX,QUIESCE,PORT command.

System programmer response

None.

Module

EZBXFUT4

Procedure name

Process_RESUME_cmd

EZD1203I**VIPADISTRIBUTE NOT ALLOWED BECAUSE *dvipa_or_intfname* IS
CURRENTLY DEACTIVATED**

Explanation

A VIPADISTRIBUTE DEFINE or DELETE statement appeared in the file referenced by a VARY TCPIP,,OBEYFILE command, but the specified dynamic virtual P address (DVIPA) has been deactivated and distribution cannot be added or changed while the DVIPA is deactivated.

dvipa_or_intfname:

- For IPv4, this is the DVIPA that is specified on the VIPADISTRIBUTE statement.
- For IPv6, this is the interface name that is specified on the VIPADISTRIBUTE statement.

System action

TCP/IP continues. The specified DVIPA remains deactivated with its distribution definitions unchanged.

Operator response

Contact the system programmer.

System programmer response

If you want to change the distribution for this DVIPA before reactivating it, you must issue a VARY TCPIP,,OBEYFILE command referencing a file containing a VIPADELETE statement for the DVIPA. Because the DVIPA is deactivated, this will delete both the DVIPA and its distribution definitions. To redefine the DVIPA on

this stack, issue a VIPADefine or VIPABCKUP statement, followed by any VIPADISTRIBUTE statements, for the DVIPA. This can be done with the same, or a subsequent, VARY TCPIP,,OBEYFILE command.

Module

EZD1209E	<i>tcpstackname</i> DETERMINED THAT ALL MONITORED INTERFACES WERE NOT ACTIVE FOR AT LEAST <i>timevalue</i> SECONDS
-----------------	---

Explanation

Sysplex problem detection has determined that all monitored interfaces are inactive.

In the message text:

tcpstackname

The name of the TCP/IP stack.

timevalue

The number of seconds during which all monitored interfaces were not active.

System action

TCP/IP continues.

- If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions occur:
 - This stack leaves the TCP/IP sysplex group.
 - This stack no longer participates in sysplex distribution (as a distributor or target) nor acts as an owner or a backup for DVIPAs. All DVIPAs defined on this stack are deactivated; however, the DVIPA definitions are saved.
 - If the problem is corrected, this operator message is deleted; if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack processes the DVIPA definitions and rejoins the TCP/IP sysplex group.
- If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action is taken. If the problem is corrected, this operator message is deleted.

See the information about [network interfaces monitoring and sysplex problem detection and recovery in z/OS Communications Server: IP Configuration Guide](#) for more information.

See the information about the [GLOBALCONFIG statement in z/OS Communications Server: IP Configuration Reference](#) for the definitions of the SYSPLEXMONITOR parameters.

Operator response

Contact the system programmer.

System programmer response

Issue the Netstat DEvlinks/-d command to determine which interfaces are being monitored; check the system log for any messages related to the status of monitored interfaces. If the monitored interfaces are inactive as a result of stopping devices or interfaces, disable the monitoring of these interfaces by specifying the NOMONSYSPLEX keyword on the LINK and INTERFACE statement through the VARY TCPIP,,OBEYFILE command before stopping the devices or interfaces. See the information about the [Summary of DEVICE and LINK statements](#) and the [Summary of INTERFACE statements in z/OS Communications Server: IP Configuration Reference](#) for more information. If you cannot determine why the monitored interfaces are inactive, contact IBM software support services after obtaining the system log and the TCPIP profile.

If this problem can be corrected, this operator message is deleted.

- If RECOVERY and NOAUTOREJOIN are active, then issue the VARY TCPIP,,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed, and cause the stack to rejoin the TCP/IP sysplex group.
- If RECOVERY and AUTOREJOIN are active, no further actions are needed. The stack processes the DVIPA definitions and rejoins the TCP/IP sysplex group.
- If NORECOVERY is active, no further actions are needed.

User response

Not applicable.

Problem determination

Not applicable.

Module

EZBXFPDM

Example

None.

EZD1210E	<i>tcpstackname</i> DETERMINED THAT NO DYNAMIC ROUTES OVER MONITORED INTERFACES WERE FOUND FOR AT LEAST <i>timevalue</i> SECONDS
-----------------	---

Explanation

Sysplex problem detection has determined that no dynamic routes over monitored interfaces were found.

In the message text:

tcpstackname

The name of the TCP/IP stack.

timevalue

The number of seconds during which no dynamic routes over monitored interfaces were found.

System action

TCP/IP continues.

- If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions occur:
 - This stack leaves the TCP/IP sysplex group.
 - This stack no longer participates in sysplex distribution (as a distributor or target) nor acts as an owner or a backup for DVIPAs. All DVIPAs defined on this stack are deactivated; however, the DVIPA definitions are saved.
 - If the problem is corrected, this operator message is deleted; if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack processes the DVIPA definitions and rejoins the TCP/IP sysplex group.
- If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action is taken. If the problem is corrected, this operator message is deleted.

See the information about network interfaces monitoring and [sysplex problem detection and recovery](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

See the information about the [GLOBALCONFIG statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for the definitions of the SYSPLEXMONITOR parameters.

Operator response

Contact the system programmer.

System programmer response

Issue the Netstat DEvlinks/-d command to determine which interfaces are being monitored; this recovery action might be triggered because the first hop routers were brought down for maintenance. You can temporarily disable the monitoring of dynamic routes by specifying MONINTERFACE NODYNROUTE on the GLOBALCONFIG SYSPLEXMONITOR statement through the VARY TCPIP,,OBEYFILE command. If you still cannot determine why the routes were lost, see the information about [diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide](#) for more information.

If this problem can be corrected, this operator message is deleted.

- If RECOVERY and NOAUTOREJOIN are active, then issue the VARY TCPIP,,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed, and cause the stack to rejoin the TCP/IP sysplex group.
- If RECOVERY and AUTOREJOIN are active, no further actions are needed. The stack processes the DVIPA definitions and rejoins the TCP/IP sysplex group.
- If NORECOVERY is active, no further actions are needed.

User response

Not applicable.

Problem determination

Not applicable.

Module

EZBXFPDM

Example

None.

EZD1211E	<i>tcpstackname</i> DELAYING SYSPLEX PROFILE PROCESSING - ALL MONITORED INTERFACES WERE NOT ACTIVE
-----------------	---

Explanation

The TCP/IP stack delayed joining a sysplex group and delayed processing sysplex definitions in the profile (VIPADYNAMIC and IPCONFIG/IPCONFIG6 DYNAMICXCF statements).

In the message text:

tcpstackname

The name of the TCP/IP stack.

System action

TCP/IP continues.

Operator response

If you want the TCP/IP stack to immediately join a sysplex group rather than wait for monitored interfaces to be active, issue the VARY TCPIP,,OBEYFILE command with GLOBALCONFIG SYSPLEXMONITOR NOMONINTERFACE specified. See the information about the GLOBALCONFIG statement in [z/OS Communications Server: IP Configuration Reference](#) for information about the MONINTERFACE keyword.

When at least one monitored interface becomes active, TCP/IP joins a sysplex group and finishes processing the sysplex definitions.

System programmer response

None.

User response

Not applicable.

Problem determination

Not applicable.

Module

EZBXFDYN

Example

None.

EZD1212E	<i>tcpstackname</i> DELAYING SYSPLEX PROFILE PROCESSING - NO DYNAMIC ROUTES OVER MONITORED INTERFACES WERE FOUND
-----------------	---

Explanation

The TCP/IP stack delayed joining a sysplex group and delayed processing sysplex definitions in the profile (VIPADYNAMIC and IPCONFIG/IPCONFIG6 DYNAMICXCF statements).

In the message text:

tcpstackname

The name of the TCP/IP stack.

System action

TCP/IP continues.

Operator response

If you want the TCP/IP stack to immediately join a sysplex group rather than wait for dynamic routes over monitored interfaces to be found, issue the VARY TCPIP,,OBEYFILE command with the GLOBALCONFIG SYSPLEXMONITOR NOMONINTERFACE option or the NODYNROUTE option specified. See the information about the GLOBALCONFIG statement in [z/OS Communications Server: IP Configuration Reference](#) for information about the MONINTERFACE and DYNROUTE keywords.

When at least one dynamic route over monitored interfaces is found, TCP/IP joins a sysplex group and finishes processing the sysplex definitions.

If OMPROUTE is active, and the expected dynamic routes over the monitored interfaces are not being generated, contact the system programmer.

System programmer response

Issue the Netstat DEvlinks/-d command to determine which interfaces are being monitored. If the first hop routers were stopped for maintenance, this might be the reason why dynamic routes are not being generated. If you cannot determine why the routes are not being created, see the information about [diagnosing OMPROUTE problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#).

User response

Not applicable.

Problem determination

Not applicable.

Automation

This message is written to the console. Automation can use this message to start applications which require Dynamic VIPA addresses to be available or which will create Dynamic VIPA addresses.

Procedure name

mainline

Explanation

This message is written the first time the multilevel security consistency check is performed on a stack. It is also written each time the stack determines that the system has returned to MLACTIVE after being changed to NOMLACTIVE. When running on an MLACTIVE system, TCPIP performs a multilevel security consistency check in any of the following situations:

- After initial profile processing.

- After every VARY TCPIP,,OBEYFILE command.
- After SYSPLEX dynamic VIPA changes.
- When it receives an ENF signal from RACF that indicates that a RACLIST REFRESH was done for the SERVAUTH or SECLABEL class.

tcpjobname is the name of the TCPIP job.

stkuser is the user ID of this TCPIP job.

stksl is the security label of this TCPIP job, or **<NONE>** if the job was started without a security label.

System action

Processing continues.

Operator response

None.

System programmer response

None. See [z/OS Communications Server: IP Diagnosis Guide](#) for information about how to set the user and seclabel values.

Module

EZBTIMDF

Procedure name

EZD1216I

MLSCHK SUCCEEDED STACK *tcpjobname* IS MULTILEVEL SECURE

Explanation

When running on an MLACTIVE system, TCPIP performs a multilevel security consistency check in any of the following situations:

- After initial profile processing.
- After every VARY TCPIP,,OBEYFILE command.
- After SYSPLEX dynamic VIPA changes.
- When it receives an ENF signal from RACF that indicates that a RACLIST REFRESH was done for the SERVAUTH or SECLABEL class.

No configuration inconsistencies were found. This message is issued the first time multilevel security checking completes successfully after the stack is started or the first time it completes successfully after a failure.

tcpjobname is the job TCPIP JOBNAME.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1217I	MLSCHK FAILED STACK <i>tcpjobname</i> - <i>count</i> MESSAGES WRITTEN TO JOBLOG
-----------------	--

Explanation

When running on an MLACTIVE system, TCPIP performs a multilevel security consistency check in any of the following situations:

- After initial profile processing.
- After every VARY TCPIP,,OBEYFILE command.
- After SYSPLEX dynamic VIPA changes.
- When it receives an ENF signal from RACF that indicates that a RACLIST REFRESH was done for the SERVAUTH or SECLABEL class.

At least one configuration inconsistency was found and reported in a message.

tcpjobname is the TCPIP JOBNAME.

count is the number of problem messages written to the job log.

System action

The GLOBALCONFIG [NO]MLSCHKTERMINATE setting in TCPIP PROFILE determines the action, as follows:

- MLSCHKTERMINATE indicates that this stack will end because of the reported errors.
- NOMLSCHKTERMINATE indicates that this stack will not end even though it cannot correctly enforce multilevel security policies.

Operator response

Save the job log and contact the system programmer.

System programmer response

Review the MLSCHK messages in the job log. Correct the indicated problems in TCPIP PROFILE or security server profiles. See [z/OS Communications Server: IP Diagnosis Guide](#) for more information about diagnosing TCPIP access control problems.

Module

EZBTIMDF

Procedure name

EZD1218I	MLSCHK ENDED STACK <i>tcpjobname</i>
-----------------	---

Explanation

This message is written when a stack that was performing multilevel security consistency checks determines that the system is now NOMLACTIVE. This stack discontinued checking TCP/IP and security server configurations for multilevel security consistency.

tcpjobname is the name of the TCPIP job.

System action

Processing continues.

Operator response

None.

System programmer response

None.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1219I**MLSCHK NETACCESS NOT CONFIGURED WHEN MLACTIVE**

Explanation

The TCPIP PROFILE for this stack does not contain a valid NETACCESS statement when running in a multilevel secure environment. The stack does not enforce multilevel security policies when NETACCESS is not configured. The NETACCESS statement must specify both INBound and OUTBound and must contain at least one valid security zone definition.

System action

TCPIP continues.

Operator response

Contact the system programmer.

System programmer response

Add a NETACCESS INBound OUTBound statement with at least one network security zone to the PROFILE for this stack.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1220I**MLSCHK REQUIRED SERVAUTH PROFILE NOT FOUND RESNM
*resource name***

Explanation

In a multilevel secure environment, a required security product profile could not be found.

resourcename is the name of the resource that must be covered by a profile in the SERVAUTH class.

System action

TCPIP continues.

Operator response

Contact the system programmer.

System programmer response

Define a security product profile that covers the resource name in the SERVAUTH class. Verify that the SERVAUTH class is active. If changes have been made, issue RACF command SETROPTS RACLIST(SERVAUTH) REFRESH or equivalent security product command. See [z/OS Communications Server: IP Configuration Guide](#) for information about the syntax of *resourcename*.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1221I

**MLSCHK STACKACCESS PROFILE HAS WRONG SECLABEL *profsl*
RESNM *resourcename* PRFNM *profilename***

Explanation

While TCPIP is running in a multilevel secure environment, the STACKACCESS profile must have the same security label as the TCPIP job. The TCPIP job security label is displayed in message EZD1215I. The security label must remain defined and active for the duration of the TCPIP job. If any changes are made to either the seclabel class or the servauth class, that class must be refreshed.

profsl is the security label defined in the SECLABEL field in this SERVAUTH profile. If the SECLABEL field is blank, *profsl* will be **<NONE>**.

resourcename is the name of the STACKACCESS resource.

profilename is the SERVAUTH profile found for this resource.

System action

TCPIP continues.

Operator response

Contact the system programmer.

System programmer response

Verify that the security label is defined, and active on this system. If necessary, alter the SECLABEL on the profile in the SERVAUTH class to the same security label as the TCPIP job. You might need to define a less generic profile that covers this resource name in the SERVAUTH class. If any changes are made to either the seclabel class or the servauth class, that class must be refreshed. Issue RACF command SETROPTS RACLIST(class name)

REFRESH. See [z/OS Communications Server: IP Diagnosis Guide](#) for more information about diagnosing TCPIP access control problems.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1222I	MLSCHK LOCAL INTERFACE IS NOT IN A NETWORK SECURITY ZONE IPADR <i>ipaddress</i> IF <i>ifcname</i>
-----------------	--

Explanation

In a multilevel secure environment, all interface addresses must be configured into a NETACCESS security zone. *ipaddress* is the IP address on the local interface.
ifcname is the name of the INTERFACE or IPv4 LINK statement that defined this IP address.

System action

TCPIP continues.

Operator response

Contact the system programmer.

System programmer response

Verify that this IP address is intended to be defined to this TCPIP stack. If so, modify the NETACCESS statement so that it maps the IP address into the correct security zone. See [z/OS Communications Server: IP Configuration Guide](#) for information about configuring Network Access Control.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1223I	MLSCHK LOCAL ZONE HAS INCORRECT SECLABEL <i>zonesl</i> IPADR <i>ipaddress</i> IF <i>ifcname</i> ZONE <i>zonename</i> <i>zoneentry</i> RESNM <i>resourcename</i> PRFNM <i>profilename</i>
-----------------	---

Explanation

In a multilevel secure environment, an interface is configured into a NETACCESS security zone with an incorrect security label for the TCPIP job that owns the interface. See message EZD1215I for the security label of the TCPIP job. Local interface addresses must be in zones with the same security label as the TCPIP job. VIPAs on an unrestricted stack may be in a security zone with any security label that is currently active on that system. VIPAs on a restricted stack must be in zones with a security label that is not SYSMULTI and is equivalent to the TCPIP job.
zonesl is the security label defined in the SECLABEL field in this SERVAUTH profile. If the SECLABEL field is blank, *zonesl* will be **<NONE>**.
ipaddress is the IPv4 or IPv6 address on the local interface.

ifcname is the name of the INTERFACE or IPv4 LINK statement that defined this IP address.
zonename is the security zone name defined in the NETACCESS zone entry for this IP address.
zoneentry is the NETACCESS zone entry for this IP address. *zoneentry* will one of the following:

- DEFAULT
- DEFAULTHOME
- ipaddress/masklength

resourcename is the name of the SERVAUTH resource.

profilename is the name of the SERVAUTH profile that covers this resource name.

System action

TCPIP continues.

Operator response

Contact the system programmer.

System programmer response

Verify that:

- The IP address is intended to be owned by this TCPIP JOB.
- The NETACCESS statement maps the IP address into the correct security zone.
- The resource name is covered by the intended profile in the SERVAUTH class.
- The profile has the correct security label defined.
- The security label is defined and active on this system.

See [z/OS Communications Server: IP Diagnosis Guide](#) for more information about diagnosing TCPIP access control problems.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1224I

MLSCHK STACK SECLABEL *stksl* IS NOT VALID

Explanation

When running on an MLACTIVE system, the TCPIP job must run under a user ID with a security label. The security label must remain defined and active while TCPIP is running.

stksl is the security label of this TCPIP job, or **<NONE>** if the job was started without a security label.

System action

TCPIP continues.

Operator response

Contact the system programmer.

System programmer response

Verify that:

- The stack is running under the correct user ID.
- The USER profile has the correct default seclabel.
- The security label is defined and active on this system.
- The user ID has READ authority to the security label.

If the user ID or user security label are incorrect, stop TCPIP, correct the problem and start it again.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1225I	MLSCHK <i>iptype ipaddr</i> IS NOT IN A NETWORK SECURITY ZONE
-----------------	--

Explanation

In a multilevel secure environment, *ipaddr* must be configured into a NETACCESS security zone with a security label the same as the TCPIP job.

iptype is either INADDR_ANY, IN6ADDR_ANY or TCPSTACKSOURCEVIPA.

ipaddr is the associated IP address.

System action

TCPIP continues.

Operator response

Contact the system programmer.

System programmer response

If the *iptype* is TCPSTACKSOURCEVIPA, verify that this IP address is intended to be used by this TCPIP JOB. Modify the NETACCESS statement so that it maps the IP address into the correct security zone.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1226I	MLSCHK <i>iptype ipaddr</i> HAS INCORRECT SECLABEL <i>zonesl</i> ZONE <i>zonename zoneentry RESNM resourcename PRFNM profilename</i>
-----------------	---

Explanation

In a multilevel secure environment, *ipaddr* must be configured into a NETACCESS security zone with a security label the same as the TCPIP job. See message EZD1215I for the security label of the TCPIP job.

iptype is one of INADDR_ANY, IN6ADDR_ANY or TCPSTACKSOURCEVIPA.

ipaddr is the associated IP address.

zonesl is the security label defined in the SECLABEL field in this SERVAUTH profile. If the SECLABEL field is blank, *zonesl* will be **<NONE>**.

zonename is the security zone name defined in the NETACCESS zone entry for this IP address.

zoneentry is the NETACCESS zone entry for this IP address. *zoneentry* is either:

- DEFAULT
- DEFAULTHOME
- ipaddress/masklength.

resourcename is the name of the SERVAUTH resource.

profilename is the name of the SERVAUTH profile that covers this resource name.

System action

TCPIP continues.

Operator response

Contact the system programmer.

System programmer response

If the *iptype* is TCPSTACKSOURCEVIPA, verify that this IP address is intended to be used by this TCPIP job. Verify that:

- The NETACCESS statement maps the IP address into the correct security zone.
- The resource name is covered by the intended profile in the SERVAUTH class.
- The profile has the correct security label defined.
- The security label is defined and active on this system.

See [z/OS Communications Server: IP Diagnosis Guide](#) for more information about diagnosing TCPIP access control problems.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1227I

MLSCHK NETACCESS *value* NOT CONFIGURED WHEN MLACTIVE

Explanation

The TCPIP PROFILE for this stack does not contain a valid NETACCESS statement when running in a multilevel secure environment. The stack does not fully enforce multilevel security policies when NETACCESS is not completely configured. The NETACCESS statement must specify both INBound and OUTBound and must contain at least one valid security zone definition.

value is one of the following:

- INBOUND to indicate that the NETACCESS statement INBound parameter is missing.
- OUTBOUND to indicate that the NETACCESS statement OUTBound parameter is missing.
- SECURITY ZONE to indicate that the NETACCESS statement does not contain any zone entries.

System action

TCPIP continues.

Operator response

Contact the system programmer.

System programmer response

Add a NETACCESS INBound OUTBound statement with at least one network security zone to the PROFILE for this stack.

Module

EZBTIMDF

Procedure name

MLSCheck

EZD1228I**MLSCHK INTERFACE *ifcname* AUTOCONFIGURED WHEN MLACTIVE**

Explanation

In a multilevel secure environment, an IPv6 interface is found to be incorrectly configured to allow IP addresses to be dynamically autoconfigured. In a multilevel secure network all IP addresses must be manually configured so they can be correctly configured into NETACCESS security zones. All IPv6 INTERFACE statements must specify INTFID to complete the Link Local address. For all IPv6 interface types that support autoconfiguration, the INTERFACE statement must specify at least one IPADDR to disable autoconfiguration. If IPCONFIG6 DYNAMICXCF is configured, it must also specify INTFID to complete the Link Local address.

ifcname is the name of the INTERFACE statement that incorrectly allows autoconfigured addresses.

System action

Processing continues.

Operator response

Contact the system programmer.

System programmer response

Verify the following:

- The named INTERFACE statement specifies a manual interface ID with the INTFID parameter.
- If IPCONFIG6 DYNAMICXCF is configured, the statement also specifies a manual interface ID with the INTFID parameter.
- If the named INTERFACE statement is of a type that supports dynamic address autoconfiguration, the statement also specifies at least one manually configured prefix or IP address with the IPADDR parameter.

See [z/OS Communications Server: IP Configuration Guide](#) for more information about IPv6 dynamic address autoconfiguration.

EZD1237I *applname* MODIFY COMMAND SYNTAX ERROR AT '*location*'

Explanation

The application detected a syntax error in a MODIFY command.

In the message text:

applname

The name of the application. The application name can be one of the following:

- ADNR for the automated domain name registration (ADNR) application
- LBADV for the z/OS Load Balancing Advisor (Advisor)

- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Advisor or Agent, if it is configured for subplexing

location

The part of the entered command that is not syntactically valid.

System action

The MODIFY command is rejected.

Operator response

Re-enter the MODIFY command using valid syntax. See the information about the MODIFY command: [z/OS Load Balancing Advisor or the Agent's MODIFY procname, QUIESCE command or MODIFY command for ADNR in z/OS Communications Server: IP System Administrator's Commands](#) for more information.

System programmer response

None.

User response

Re-enter the MODIFY command using valid syntax. See the information about the MODIFY command: [z/OS Load Balancing Advisor or the Agent's MODIFY procname, QUIESCE command or MODIFY command for ADNR in z/OS Communications Server: IP System Administrator's Commands](#) for more information.

***applname* MODIFY COMMAND PARAMETER *parm* INCORRECT VALUE
*value***

Explanation

The z/OS Load Balancing Advisor (Advisor) or z/OS Load Balancing Agent (Agent) detected an incorrect value for a parameter on a MODIFY command.

In the message text:

applname

The name of the application. Possible values are:

- LBADV for the z/OS Load Balancing Advisor (Advisor)
- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Advisor or Agent, if it is configured for subplexing

parm

The name of the MODIFY command parameter that is in error.

value

The incorrect value entered on the MODIFY command.

System action

The MODIFY command is rejected.

Operator response

Re-enter the MODIFY command with a valid value for the indicated parameter. See the information about the MODIFY command: [z/OS Load Balancing Advisor](#) or the [Agent's MODIFY proname, QUIESCE command in z/OS Communications Server: IP System Administrator's Commands](#) for more information.

System programmer response

None.

Module

EZD1239I

applname type CALL FAILED errno/errnojr FOR PORT port

Explanation

The z/OS Load Balancing Advisor (Advisor) or z/OS Load Balancing Agent (Agent) was unable to initialize a listening socket.

In the message text:

applname

The name of the application. Possible values are:

- LBADV for the z/OS Load Balancing Advisor (Advisor)
- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Advisor or Agent, if it is configured for subplexing

type

The type of call that failed. For example, the type might be a SOCKET, SETSOCKOPT, or BIND call.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

port

The port number on which the call failed.

System action

The application ends.

Operator response

Check to see whether TCP/IP is available. Restart TCP/IP if necessary. Restart the application. If TCP/IP is available when the application issues this message, save the syslogd file and contact the system programmer.

System programmer response

If TCP/IP is available when the application issues this message, examine the syslogd file and correct the error.

Module

lmlisten.c

Procedure name

lmlisten_sock_init

EZD1240I *applname* **UNABLE TO ESTABLISH endpoint LISTENING SOCKET****Explanation**

The z/OS Load Balancing Advisor (Advisor) or z/OS Load Balancing Agent (Agent) was unable to initialize because it could not get a listening socket.

In the message text:

applname

The name of the application. Possible values are:

- LBADV for the z/OS Load Balancing Advisor (Advisor)
- The job name of the Advisor, if it is configured for subplexing

endpoint

The *endpoint* value can be LOAD BALANCER or AGENT. AGENT is a z/OS Load Balancing Agent.

System action

The application ends.

Operator response

Check to see whether TCP/IP is available. Restart TCP/IP if necessary. Restart the application. If TCP/IP is available when the application issues this message, save the syslogd file and contact the system programmer.

System programmer response

If TCP/IP is available when the application issues this message, examine the syslogd file and correct the error.

Module

lmlisten.c

Procedure name

socket_listener

EZD1241I***applname* DEBUG LEVEL *level***

Explanation

This message is issued in response to a z/OS Load Balancing Advisor (Advisor), z/OS Load Balancing Agent (Agent), or z/OS automated domain name registration (ADNR) MODIFY *procname*,DISPLAY,DEBUG command and the ADNR MODIFY *procname*,DEBUG,LEVEL command.

If the *applname* value is the automated domain name registration application, then the enumerated debug levels are also displayed. These enumerated debug settings are displayed on a line separate from the message text.

In the message text:

applname

The name of the application. The application name can be one of the following:

- ADNR for the automated domain name registration (ADNR) application
- LBADV for the z/OS Load Balancing Advisor (Advisor)
- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Advisor or Agent, if it is configured for subplexing

level

The current debug level in effect. Possible values are:

1

Errors are logged.

2

Warnings are logged.

4

Significant events are logged.

8

Informational messages are logged.

16

Debug data messages are logged. This level is intended for IBM service use only.

- If the *applname* value is LBADV, then messages related to TCP/IP messages sent between the Advisor and load balancers, between the Advisor and ADNR, and between the Advisor and Agent are logged.
- If the *applname* value is ADNR, then messages related to the detailed contents of message packets that are sent between the Global Workload Manager (GWM) and the automated domain name registration application are logged.

32

Debug data messages are logged. This level is intended for IBM service use only.

- If the *applname* value is LBAGENT, then messages related to data collection and manipulation that support weight calculations are logged.
- If the *applname* value is ADNR, then messages related to the details of ADNR managing the data in the domain name server zones are logged.

64

Internal debug data are logged. This level is intended for IBM service use only.

128

Function entry and exit tracing is logged. This level is intended for IBM service use only.

Individual values can be added together. For example, if the debug level displayed is 7, all error, warning, and event messages are logged. These messages are logged to the syslogd file.

EZD1246I

applname INITIALIZATION ERROR - REASON CODE *reason*

Explanation

The application could not initialize because it detected an error.

In the message text:

applname

The name of the application. The application name can be one of the following:

- ADNR for the automated domain name registration (ADNR) application
- LBADV for the z/OS Load Balancing Advisor (Advisor)
- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Advisor or Agent, if it is configured for subplexing

reason

The reason code for the error. Possible values are:

1

Another copy of the application is already active.

- If subplexing is being used:
 - Only one copy of the Advisor can be active in the subplex.
 - On each MVS system, only one copy of the Agent can be active for each subplex on that system.
- If subplexing is not being used:
 - Only one copy of the Advisor can be active in the sysplex.
 - Only one copy of the Agent can be active on each MVS system in the sysplex.

This reason code does not apply to ADNR.

2

The Agent, Advisor, or ADNR application cannot open the configuration file, or found an error in the configuration file. Message EZD1235I should precede this message. See the information about [Advisor and Agent in z/OS Communications Server: IP Configuration Reference](#) for information about configuring the Advisor, and for information about the Agent. See the information about [ADNR application in z/OS Communications Server: IP Configuration Reference](#) for information about configuring the ADNR application.

3

Indicates an internal error in the application.

4

The Agent, Advisor, or ADNR application found an error in a start option parameter in the start procedure.

5

The user ID associated with the started task is not authorized, or the application was not started as a started procedure. See [z/OS Communications Server: IP Configuration Guide](#) for information about setting up the authorization profiles for the security product.

6

A required resource is not available. For example, the TCP/IP stack is not started, or a configured IP address is not defined or available on the TCP/IP stack, or the Advisor or Agent was configured for subplexing and a TCP/IP stack or VTAM node corresponding to the specified TCP/IP sysplex group name could not be found.

System action

The application ends.

Operator response

- If the *reason* value is 1, then verify that the copy of the application that is active is the one that is wanted. If a previous copy of the application was stopped but never ended, issue a CANCEL command to cancel the previous copy before starting the new copy.
- If the *reason* value is 6, then start the TCP/IP stack, if it is not already started.

- If the stack is already started, and for all other *reason* values, save the syslogd file and contact the system programmer.

System programmer response

Take action appropriate for the reason as follows:

- 1**
If subplexing is being used, ensure that the correct TCP/IP sysplex group name is coded in the configuration file for the Agent and Advisor in each subplex.
- 2**
Examine the application syslogd file for errors. Correct the configuration file as needed.
- 3**
Contact IBM software support center. The application syslogd file is the minimum diagnostic data that should be provided. See [z/OS Communications Server: IP Diagnosis Guide](#) for information about collecting diagnostic data.
- 4**
Examine the application syslogd file for errors. Correct the start procedure as needed.
- 5**
Examine the security product profiles that have been established for the Advisor, Agent, and ADNR. Ensure that the application was started from a started procedure and that the user ID in the start procedure is permitted to the appropriate profiles if they are defined.
- 6**
Examine the application syslogd file for errors. Verify that the correct IP addresses are configured in the configuration file. Correct the configuration file as needed. See the information about the Advisor and Agent in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring the Advisor, and for information about the Agent. See the information about ADNR application in [z/OS Communications Server: IP Configuration Reference](#) for information about configuring the ADNR application.

User response

- If the *reason* value is 1, then verify that the copy of the application that is active is the copy that is wanted. If a previous copy of the application was stopped but never ended, issue a CANCEL command to cancel the previous copy before starting the new copy.
- If the *reason* value is 6, then start the TCP/IP stack, if it is not already started.
- If the stack is already started, and for all other reason values, save the syslogd file and contact the system programmer.

Problem determination

To ensure that there is sufficient information to debug this problem, configure the application to use a debug level of 127 and restart the application. See [z/OS Communications Server: IP Configuration Reference](#) for information about how to configure the debug level for the specified application.

Contact IBM software support center. The application syslogd file is the minimum diagnostic data that should be provided. See [z/OS Communications Server: IP Diagnosis Guide](#) for information about collecting diagnostic data.

Problem determination

EZD1247I***applname* CONFIGURATION WARNINGS DETECTED**

Explanation

The application configuration file contains one or more warnings. These warnings do not cause the application to end, but might indicate conditions that affect the normal operation of the application.

In the message text:

applname

The name of the application. The application name can be one of the following:

- ADNR for the automated domain name registration (ADNR) application
- LBADV for the z/OS Load Balancing Advisor (Advisor)
- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Advisor or Agent, if it is configured for subplexing

System action

Processing continues.

Operator response

Save the syslogd file and contact the system programmer.

System programmer response

Examine the syslogd file for the application configuration warning messages. The syslogd identifier is lbadv for the Advisor, lbagent for the Agent, or adnr for the automated domain name registration application. Correct the configuration file warnings. For the Advisor or Agent, restart the application at the earliest opportunity. For the automated domain name registration application, issue the MODIFY REFRESH command. See the information about [Advisor and Agent](#) or [ADNR application](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring the application.

User response

Save the syslogd file and contact the system programmer.

EZD1248I *applname* ALL APPLICATIONS ARE ALREADY QUIESCED BY OPERATOR

Explanation

This message is issued in response to a z/OS Load Balancing Agent (Agent) MODIFY *procname*,QUIESCE or MODIFY *procname*,ENABLE command. A previous MODIFY *procname*,QUIESCE,SYSTEM command was issued to quiesce all applications for this Agent.

In the message text:

applname

The name of the application. The application name can be one of the following:

- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Agent, if it is configured for subplexing

System action

The MODIFY command is rejected because all applications are already quiesced.

Operator response

Issue the Agent MODIFY *procname*,DISPLAY,MEMBERS command to list the registered members on the local MVS system and the status flags for each member. The operator quiesce flag (SYSQ, TCPQ, or APPQ) indicates that an MVS operator quiesced the member. The absence of this flag indicates that the member is enabled from an MVS operator perspective. To remove the flag, enter a MODIFY,*procname*,Enable command, and then optionally a MODIFY,*procname*,QUIESCE command to change the scope of the members quiesced. See the information about the [Agent's MODIFY *procname*,QUIESCE command](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for more information.

System programmer response

None.

Module

lacmd.c

Procedure name

eq_engine

EZD1249I

***applname* ALL APPLICATIONS ARE ALREADY ENABLED BY OPERATOR**

Explanation

This message is issued in response to a z/OS Load Balancing Agent (Agent) MODIFY *procname*,ENABLE,SYSTEM command. A previous MODIFY *procname*,ENABLE,SYSTEM command was issued to enable all applications for this Agent, or a MODIFY *procname*,QUIESCE,SYSTEM command was never issued.

In the message text:

applname

The name of the application. The application name can be one of the following:

- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Agent, if it is configured for subplexing

System action

The MODIFY command is rejected because all members in this MVS system are already enabled from an operator perspective. This means that all members are enabled from an MVS operator perspective unless they were individually quiesced by an MVS operator. Members that are individually quiesced by an MVS operator must be individually enabled by the MVS operator.

Operator response

Issue the Agent MODIFY *procname*,DISPLAY,MEMBERS command to list the registered members on the local MVS system and the status flags for each member. The operator quiesce flag (SYSQ, TCPQ, or APPQ) indicates that an MVS operator quiesced the member. The absence of this flag indicates that the member is enabled from an MVS operator perspective. If the flag value is not wanted, enter a MODIFY *procname*,QUIESCE or a MODIFY *procname*,ENABLE command to change the flag value. See the information about the [Agent's MODIFY *procname*,QUIESCE command](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for more information.

System programmer response

None.

Module

EZD1250I

***applname* ALL APPLICATIONS FOR *stackname* ARE ALREADY QUIESCED BY OPERATOR**

Explanation

This message is issued in response to a z/OS Load Balancing Agent (Agent) MODIFY *procname*,QUIESCE,TCP=*stackname* command. A previous MODIFY *procname*,QUIESCE,TCP=*stackname* command was issued to quiesce all applications for the TCP/IP stack.

In the message text:

applname

The name of the application. The application name can be one of the following:

- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Agent, if it is configured for subplexing

stackname

The name of the TCP/IP stack.

System action

The MODIFY command is rejected because an MVS operator previously quiesced all applications on the stack.

Operator response

Issue the Agent MODIFY *procname*,DISPLAY,MEMBERS command to list the registered members on the local MVS system and the status flags for each member. The operator quiesce flag (SYSQ, TCPQ, or APPQ) indicates that an MVS operator quiesced the member. The absence of this flag indicates that the member is enabled from an MVS operator perspective. If the flag value is not wanted, enter a MODIFY *procname*,QUIESCE or a MODIFY *procname*,ENABLE command to change the flag value. See the information about the [Agent's MODIFY *procname*,QUIESCE command in z/OS Communications Server: IP System Administrator's Commands](#) for more information.

System programmer response

None.

EZD1251I	<i>applname</i> ALL APPLICATIONS FOR <i>stackname</i> ARE ALREADY ENABLED BY OPERATOR
-----------------	--

Explanation

This message is issued in response to a z/OS Load Balancing Agent (Agent) MODIFY *procname*,ENABLE,TCP=*stackname* command. A previous MODIFY *procname*,ENABLE,TCP=*stackname* or MODIFY *procname*,ENABLE,SYSTEM command was issued to enable all applications for the TCP/IP stack or system, or a MODIFY *procname*,QUIESCE,TCP=*stackname* command was never issued.

In the message text:

applname

The name of the application. The application name can be one of the following:

- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Agent, if it is configured for subplexing

stackname

The name of the TCP/IP stack.

System action

The MODIFY command is rejected because all members for the stack are already enabled from an MVS operator perspective.

Operator response

Issue the Agent MODIFY *procname*,DISPLAY,MEMBERS command to list the registered members on the local MVS system and the status flags for each member. The operator quiesce flag (SYSQ, TCPQ, or APPQ) indicates that an MVS operator quiesced the member. The absence of this flag indicates that the member is enabled from an MVS operator perspective. If the flag value is not wanted, enter a MODIFY *procname*,QUIESCE or a MODIFY *procname*,ENABLE command to change the flag value. EZD1252I

***applname* NO MEMBERS MATCH SELECTION CRITERIA**

Explanation

This message is issued in response to a z/OS Load Balancing Agent (Agent) MODIFY *procname*,QUIESCE or a MODIFY *procname*,ENABLE command. The MODIFY command is rejected because no active registered target applications match the criteria specified in the MODIFY command.

This message is also issued in response to a MODIFY *procname*,QUIESCE,TCP=*stackname* or MODIFY *procname*,ENABLE,TCP=*stackname* command when the *stackname* does not match a TCP/IP stack active on the Agent system.

In the message text:

applname

The name of the application. The application name can be one of the following:

- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Agent, if it is configured for subplexing

System action

The MODIFY command is ignored. Processing continues.

Operator response

Issue the Agent MODIFY *procname*,DISPLAY,MEMBERS command to list the registered members on the local MVS system and the status flags for each member. The operator quiesce flag (SYSQ, TCPQ, or APPQ) indicates that an MVS operator quiesced the member. The absence of this flag indicates that the member is enabled from an MVS operator perspective. If the flag value is not wanted, enter a MODIFY *procname*,QUIESCE or a MODIFY *procname*,ENABLE command to change the flag value. ***applname command* COMMAND REJECTED**

Explanation

This message is issued in response to a z/OS Load Balancing Agent (Agent) MODIFY *procname*, QUIESCE or a MODIFY *procname*, ENABLE command. The MODIFY command is rejected. A more specific error message precedes this message that explains the reason for the command rejection.

In the message text:

applname

The name of the application. Possible values are:

- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Agent, if it is configured for subplexing

command

The command that was rejected. Possible values are:

- QUIESCE SYSTEM
- ENABLE SYSTEM
- QUIESCE TCPNAME
- ENABLE TCPNAME
- QUIESCE APPLICATION
- ENABLE APPLICATION

System action

The MODIFY command is ignored. Processing continues.

Operator response

Look for a previous message that provides more specific information about why the MODIFY command was rejected. Issue the Agent MODIFY *procname*, DISPLAY, MEMBERS command to list the registered members on the local MVS system and the status flags for each member. The operator quiesce flag (SYSQ, TCPQ, or APPQ) indicates that an MVS operator quiesced the member. The absence of this flag indicates that the member is enabled from an MVS operator perspective. If the flag value is not wanted, enter a MODIFY *procname*, QUIESCE or a MODIFY *procname*, ENABLE command to change the flag value. See the information about the Agent's MODIFY *procname*, QUIESCE command in z/OS Communications Server: IP System Administrator's Commands for more information.

EZD1255I *applname* PORT *port* IS ALREADY QUIESCED BY OPERATOR

Explanation

This message is issued in response to a z/OS Load Balancing Agent (Agent) MODIFY *procname*,QUIESCE,PORT=*port* command. The MODIFY command is rejected because all active registered target applications that match the criteria specified in the MODIFY command are already quiesced.

In the message text:

applname

The name of the application. The application name can be one of the following:

- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Agent, if it is configured for subplexing

port

The local port number that was specified on the MODIFY command.

System action

The MODIFY command is ignored. Processing continues.

Operator response

Issue the Agent MODIFY *procname*,DISPLAY,MEMBERS command to list the registered members on the local MVS system and the status flags for each member. The operator quiesce flag (SYSQ, TCPQ, or APPQ) indicates that an MVS operator quiesced the member. The absence of this flag indicates that the member is enabled from an MVS operator perspective. If the flag value is not wanted, enter a MODIFY *procname*,QUIESCE or a MODIFY *procname*,ENABLE command to change the flag value. EZD1257I *applname* ZONE *zoneLabel* IS NOT RESPONSIVE

Explanation

The application is not receiving responses from the domain name server zone.

In the message text:

applname

The name of the application. The application name is ADNR for the automated domain name registration (ADNR) application.

zoneLabel

The label of the zone in the application configuration file that is not responding. The zone identified by the *zoneLabel* value occurs in the ADNR configuration, but for reasons involving name server availability, network connectivity, or configuration mismatch, the zone cannot be updated or managed by ADNR

System action

ADNR periodically probes this zone to determine whether it is responding. This zone is not updated in the name server until the underlying cause of its unresponsiveness is corrected. ADNR continues processing.

Operator response

Contact the system programmer.

System programmer response

See the information about [diagnosing unresponsive zones](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for information about resolving this problem.

EZD1258I	<i>applname</i> AGENT CONNECTION FROM <i>ipaddress</i> CLOSED DUE TO INACTIVITY
-----------------	--

Explanation

This immediate action message is issued when the z/OS Load Balancing Advisor (Advisor) closes its connection to the z/OS Load Balancing Agent (Agent) because the Advisor did not receive a message from the Agent in the expected time. The Advisor will delete this message when the Agent connects to the Advisor.

In the message text:

applname

The name of the application. The application name can be one of the following:

- LBADV for the z/OS Load Balancing Advisor (Advisor)
- The job name of the Advisor, if it is configured for subplexing

ipaddress

The IP address of the Agent.

System action

The Agent will attempt to reconnect to the Advisor until the Agent connects with the Advisor or the Agent is stopped. If the situation is temporary, the Agent will successfully reconnect to the Advisor.

Operator response

If the Agent is not active, start it. If the error persists, contact the system programmer.

System programmer response

Network connectivity problems, routing problems, slow system performance on the Agent system, and low MVS dispatching priority for the Agent might cause this problem. If the error persists, increase the update interval in the Advisor configuration file and restart the Advisor.

Module

***applname* LOAD BALANCER CONNECTION FROM *ipaddress* IS NO LONGER ACTIVE**

Explanation

This message is issued when the z/OS Load Balancing Advisor (Advisor) detects that it lost its connection with a load balancer.

In the message text:

applname

The name of the application. The application name can be one of the following:

- LBADV for the z/OS Load Balancing Advisor (Advisor)
- The job name of the Advisor, if it is configured for subplexing

ipaddress

The IP address of the previously connected load balancer.

System action

If the load balancer is still active, the load balancer might attempt to reconnect to the Advisor.

Operator response

Check to see whether the load balancer is active. Restart the load balancer, if necessary. If the load balancer is active, contact the system programmer.

System programmer response

Check the load balancer and correct any configuration or connectivity problems. See [z/OS Communications Server: IP Diagnosis Guide](#) for information about diagnosing network connectivity problems.

Module

lmlb.c

Procedure name

lm_service_lb_connection

EZD1265I	<i>applname</i> CONNECTION TO ADVISOR <i>ipaddress</i> CLOSED DUE TO PROTOCOL ERROR
-----------------	--

Explanation

This immediate action message is issued when the z/OS Load Balancing Agent (Agent) closes its connection to the z/OS Load Balancing Advisor (Advisor) due to an internal protocol error. The Agent will delete this message when the Agent connects to the Advisor.

In the message text:

applname

The name of the application. The application name can be one of the following:

- LBAGENT for the z/OS Load Balancing Agent (Agent)
- The job name of the Agent, if it is configured for subplexing

ipaddress

The IP address of the Advisor.

System action

The Agent will take a CEEDUMP, write messages to the syslogd file, and attempt to reconnect to the Advisor. The Agent will attempt to reconnect to the Advisor until the Agent connects with the Advisor or the Agent is stopped.

Operator response

Save the dump, syslogd file, and packet trace (if active). The dump data set is specified in the CEEDUMP DD statement in the Agent's start procedure. Contact the system programmer. If the problem persists, stop the Agent.

System programmer response

Examine the syslogd files for the Advisor and Agent.

If the debug level includes Message level messages, the syslogd file will show the data that each application sent or received. If the data that was sent by one application was the same data received by the corresponding application, contact IBM software support services.

If the data that was sent was not the same data that was received, this might indicate that network integrity has been compromised.

If the packet trace was active, examine the trace for the data that was sent and received.

If the packet trace is not active, try to recreate the problem with packet trace active. See [z/OS Communications Server: IP Diagnosis Guide](#) for information about the packet trace.

Module

lczap.c

Procedure name

zap_protocol_error

EZD1266I

***applname* AGENT CONNECTION FROM *ipaddress* CLOSED DUE TO
PROTOCOL ERROR**

Explanation

This immediate action message is issued when the z/OS Load Balancing Advisor (Advisor) closes its connection with a z/OS Load Balancing Agent (Agent) as a result of an internal protocol error. The Advisor will delete this message when the Agent connects to the Advisor.

In the message text:

applname

The name of the application. The application name can be one of the following:

- LBADV for the z/OS Load Balancing Advisor (Advisor)
- The job name of the Advisor, if it is configured for subplexing

ipaddress

The IP address of the Agent.

System action

The Advisor will take a CEEDUMP and write messages to the syslogd file. If the Agent is still active, it will attempt to reconnect to the Advisor until the Agent connects with the Advisor or the Agent is stopped. If the situation is temporary, the Agent will successfully reconnect to the Advisor.

Operator response

Save the dump, syslogd file, and packet trace (if active). The dump data set is specified in the CEEDUMP DD statement in the Advisor's start procedure. Contact the system programmer. If the Agent is not active, start it.

System programmer response

Examine the syslogd files for the Advisor and Agent. If the debug level includes Message level messages, the syslogd file will show the data that each application sent or received.

If an Agent is configured to use AT-TLS and the Advisor is not, the configuration is not valid. The Advisor will issue message EZD1266I. To correct this configuration, configure the Advisor to use AT-TLS.

If the data that was sent by one application was the same data received by the corresponding application, contact IBM software support services.

If the data that was sent was not the same data that was received, this might indicate that network integrity has been compromised.

If the packet trace was active, examine the trace for the data that was sent and received.

If the packet trace is not active, try to recreate the problem with packet trace active. See [z/OS Communications Server: IP Diagnosis Guide](#) for information about the packet trace.

Descriptor code

12

Example

```
EZD1270I ADNR CONNECTED TO GWM 10.42.11.182
```

EZD1271E**ADNR CONNECTION TO GWM *gwmipaddress* IS NO LONGER ACTIVE**

Explanation

The automated domain name registration (ADNR) application no longer has a connection to the Global Workload Manager (GWM).

In the message text:

gwmipaddress

The IP address of the GWM. The IP address is specified on the `gwm_id` parameter of the `gwm` statement in the ADNR configuration file.

System action

Processing continues. The ADNR application can no longer communicate with the GWM. ADNR will periodically try the connection again. If it succeeds, the eventual action message will be deleted. See the information about [automated domain name registration](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

Operator response

If the GWM application has been stopped, no further actions are needed. When the GWM application is restarted, the ADNR application automatically reconnects to the GWM. If the GWM was not stopped and the reason for the connection attempt failure between the ADNR and GWM application cannot be determined, save the following information:

- The ADNR log file

- Any ADNR dump produced when the problem occurred
- The TCP/IP profile and system log of the TCP/IP stack used by the ADNR application
- The GWM log file
- The TCP/IP profile and system log of the TCP/IP stack used by the GWM application

Contact the system programmer.

System programmer response

Verify that routing exists between the IP address used by the ADNR application and the IP address of the GWM that is specified in the message. A route should exist from the ADNR IP address to the GWM IP address, and a route should also exist from the GWM IP address to the ADNR IP address. The IP address used by the ADNR application is found in one of the following places:

- The IP address is specified on the `host_connection_addr` parameter of the `gwm` statement that contains the corresponding `gwm_id` parameter in the ADNR configuration file.
- The IP address is displayed in message EZD1263I. This message is issued by the Load Balancing Advisor. Look for this message in the system log for the system on which the Advisor is running, at a time that corresponds approximately to the time at which this ADNR was started.

If routing exists, then check the ADNR and GWM log files for messages corresponding to the time when the connection failed. See the information about [diagnosing problems with the automated domain name registration application \(EZBADNR\)](#) in [z/OS Communications Server: IP Diagnosis Guide](#). If the reason for the connection loss cannot be determined, contact the IBM support center after obtaining the supporting TCP/IP, ADNR, and GWM documentation.

2

Example

```
EZD1271E ADNR CONNECTION TO GWM 10.42.11.182 IS NO LONGER ACTIVE
```

EZD1272E

ADNR CONNECTION ATTEMPT TO GWM *gwmipaddress* FAILED

Explanation

The automated domain name registration (ADNR) application failed to establish a connection to the Global Workload Manager (GWM).

In the message text:

gwmipaddress

The IP address of the GWM. The IP address is specified on the `gwm_id` parameter of the `gwm` statement in the ADNR configuration file.

System action

Processing continues. The ADNR application cannot communicate with the GWM. ADNR will periodically try the connection again. If it succeeds (as indicated by message EZD1270I), the eventual action message will be deleted. See the information about [automated domain name registration in z/OS Communications Server: IP Configuration Guide](#) or [diagnosing problems with the automated domain name registration application \(EZBADNR\)](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for more information.

Operator response

If the GWM application has been stopped, no further actions are needed. When the GWM application is restarted, the ADNR application automatically reconnects to the GWM. If the GWM was not stopped and the reason for the connection attempt failure between the ADNR and GWM application cannot be determined, save the following information:

- The ADNR log file
- Any ADNR dump produced when the problem occurred
- The TCP/IP profile and system log of the TCP/IP stack used by the ADNR application
- The GWM log file
- The TCP/IP profile and system log of the TCP/IP stack used by the GWM application.

Contact the system programmer.

System programmer response

Verify that routing exists between the IP address used by the ADNR application and the IP address of the GWM. A route should exist from the ADNR IP address to the GWM IP address, and a route should also exist from the GWM IP address to the ADNR IP address. The IP address of the GWM is specified in the message. The IP address used by the ADNR application is one of the following:

- Specified on the `host_connection_addr` parameter of the `gwm` statement containing the corresponding `gwm_id` parameter in the ADNR configuration file.
- Selected by the ADNR's TCP/IP stack. If `host_connection_addr` is not specified, the ADNR attempts to connect to the IP address specified in the `gwm_id` parameter. The ADNR's TCP/IP stack selects a source IP address. See the information about source IP selection in [z/OS Communications Server: IP Configuration Guide](#) for information about how TCP/IP selects a source IP address.

If routing exists, then check the ADNR and GWM log files for messages corresponding to the time when the connection failed. See the information about [diagnosing problems with the automated domain name registration application \(EZBADNR\)](#) in [z/OS Communications Server: IP Diagnosis Guide](#). If the reason for the connection attempt failure cannot be determined, contact IBM software support services after obtaining the supporting TCP/IP, ADNR and GWM documentation.

Example

```
EZD1272E ADNR CONNECTION ATTEMPT TO GWM 10.42.11.182 FAILED
```

EZD1273I**ADNR FAILED TO DELETE ZONE *zoneLabel***

Explanation

The automated domain name registration (ADNR) application failed to delete a domain name server zone that is not in the new configuration while processing a MODIFY *procname*,REFRESH command.

In the message text:

zoneLabel

The label of the zone in the ADNR configuration file.

System action

Any domain name server resource records from the old configuration remain in the domain name server zone identified by the *zoneLabel* value. Processing continues. See the information about [automated domain name registration in z/OS Communications Server: IP Configuration Guide](#) or [diagnosing problems with the automated domain name registration application \(EZBADNR\) in z/OS Communications Server: IP Diagnosis Guide](#) for more information.

Operator response

Contact the system programmer.

System programmer response

Perform one of the following actions:

- Use the Dig or Nslookup utility to perform a zone transfer of the zone to examine its contents. Based on the results from using the Dig or Nslookup utility, use the Nsupdate utility to manually remove the resource records. See the information about [querying and administrating a Domain Name System in z/OS Communications Server: IP System Administrator's Commands](#) for information about using the Nslookup, Dig, and Nsupdate commands.
- If you can wait for communications to be restored between the ADNR application and the zone's name server, see the information about [automated domain name registration in z/OS Communications Server: IP](#)

Configuration Guide. Before this communication is restored, the name server might contain stale data for this zone.

EZD1274I	<i>applname</i> NEW CONFIGURATION INFORMATION TEMPORARILY UNAVAILABLE
-----------------	--

Explanation

This message is issued in response to the specified application MODIFY DISPLAY command. A dynamic reconfiguration operation (REFRESH) is still in progress. The old configuration is being displayed, and the new (refreshed) configuration is not yet available for display.

In the message text:

applname

The name of the application. The application name is ADNR for the automated domain name registration (ADNR) application.

System action

The application continues.

Operator response

If the application is ADNR, then reissue the ADNR MODIFY DISPLAY command after the ADNR MODIFY REFRESH command has completed (as indicated when message EZD1275I ADNR REFRESH COMMAND COMPLETED is issued).

System programmer response

None.

EZD1276I	ADNR CONNECTION TO GWM <i>gwmipaddress</i> CLOSED DUE TO PROTOCOL ERROR
-----------------	--

Explanation

The automated domain name registration (ADNR) application closed the connection to the Global Workload Manager (GWM) as a result of a Server/Application State Protocol (SASP) protocol violation or a configuration mismatch. One common configuration mismatch is failing to include the IP address used by ADNR in the Advisor lb_id_list. If the lb_id_list statement is not specified in the Advisor's configuration file, AT-TLS must be configured for the connection to be fully established. See the information about ADNR application in [z/OS Communications Server: IP Configuration Reference](#) for more information about how to correctly coordinate the configuration of ADNR and the GWM.

The automated domain name registration (ADNR) application closed the connection to the Global Workload Manager (GWM) as a result of a Server/Application State Protocol (SASP) protocol violation.

In the message text:

gwmipaddress

The IP address of the GWM. The IP address is specified on the gwm_id parameter of the gwm statement in the ADNR configuration file.

System action

Processing continues. ADNR dumps its address space. The ADNR application is no longer able to communicate with the GWM. ADNR will periodically reestablish the connection to the GWM and attempt to communicate with the GWM. See the information about [automated domain name registration](#) in [z/OS Communications Server: IP Configuration Guide](#) and [diagnosing problems with the automated domain name registration application \(EZBADNR\)](#) in the [z/OS Communications Server: IP Diagnosis Guide](#) for more information.

Operator response

Save the ADNR log file, and the ADNR dump. Save the GWM log file. Contact the system programmer.

System programmer response

Review the ADNR log file and the GWM log file to determine the cause for the connection being closed. Correct any configuration mismatch errors. If the error is a SASP protocol violation, contact IBM software support services after obtaining the supporting ADNR and GWM documentation.

EZD1279I	<i>applname</i> SECURE CONNECTION REQUEST RECEIVED FROM USER <i>user_id</i> AT IP ADDRESS <i>ip_addr</i>
-----------------	---

Explanation

The Advisor received a Transport Layer Security (TLS) secure connection request at the specified IP address from the user specified by the *user_id* value. SAF authorization for access to the Advisor will be checked for the specified user ID.

In the message text:

applname

The name of the application that received the connection request. Possible values are:

- LBADV for the z/OS Load Balancing Advisor (Advisor)
- The job name of the Advisor, if it is configured for subplexing

user_id

The user identifier of the load balancer or Load Balancing Agent requesting access to the Advisor.

ip_addr

The IP address of the load balancer or Load Balancing Agent.

```
LBADV SECURE CONNECTION REQUEST RECEIVED FROM USER AGENT1 AT IP ADDRESS 192.10.1.1
```

EZD1280I *applname client* **CONNECTION ATTEMPT FROM USER *userid* AT IP ADDRESS *ip_addr* FAILED REASON CODE *reason***

Explanation

The Advisor received a connection request at the specified IP address at the specified IP address from an Agent or load balancer with the specified user ID. Authorization for connection to the Advisor failed for the specified user ID.

In the message text:

applname

The name of the application that received the connection request. Possible values are:

- LBADV for the z/OS Load Balancing Advisor (Advisor).
- The job name of the Advisor, if it is configured for subplexing.

client

The type of client that attempted to connect to the Advisor. Possible values are:

- AGENT for the z/OS Load Balancing Agent
- LB for a load balancer or ADNR connection

userid

The user ID of the load balancer or Load Balancing Agent that is requesting access to the Advisor. If the user ID is not obtained from AT-TLS, the value is UNKNOWN.

ip_addr

The IP address of the load balancer or Load Balancing Agent.

reason

A code that explains the failure. Possible values are:

- 1 The Advisor TCP/IP stack is not configured for Application Transparent Transport Layer Security (AT-TLS), and the Advisor configuration file did not allow connections from this client. The TTLS option in the TCP/IP profile TCPCONFIG statement enables the stack for AT-TLS.
- 2 There is not a usable AT-TLS policy for this connection, and the Advisor configuration file did not allow connections from this client. For example, the policy agent is not active, or the AT-TLS policy for this connection specifies the wrong port.
- 3 The AT-TLS policy defined for this onnection does not enable AT-TLS, and the Advisor configuration file did not allow connections from this client. In the policy, the TTLSGroupAction statement is not configured with TTLSEnabled set to ON.
- 4 The AT-TLS policy that is defined for this connection does not define the Advisor as a controlling application, and the Advisor configuration file did not allow connections from this client. In the policy, the TTLSEnvironmentAdvancedParms parameter is not configured with ApplicationControlled set to On for the Advisor.
- 5 The AT-TLS handshake failed for this connection, and the Advisor configuration file did not allow connections from this client.
- 6 System authorization facility (SAF) authorization failed for this connection. The SERVAUTH class profile EZB.LBA.LBACCESS.*sysname.tcpsysplexgroupname* (for a load balancer connection) or EZB.LBA.AGENTACCESS.*sysname.tcpsysplexgroupname* (for an Agent connection) exists but the user is not authorized to use this profile. The system does not use the Advisor configuration file because the user is not authorized to use the SERVAUTH class profile.
- 7 The Advisor was unable to obtain storage for processing an AT-TLS connection request, and the Advisor configuration file did not allow connections from this client.
- 8 The Advisor call to the SIOCTTLCTL IOCTL failed unexpectedly, and the Advisor configuration file did not allow connections from this client.
- 9 System authorization facility (SAF) authorization failed for this connection, and the Advisor configuration file did not allow connections from this client. The SERVAUTH class profile EZB.LBA.LBACCESS.*sysname.tcpsysplexgroupname* (for a load balancer connection) or EZB.LBA.AGENTACCESS.*sysname.tcpsysplexgroupname* (for an Agent connection) is not protected by SAF.

System action

The system continues processing. The client that attempted to connect to the Advisor might continue to attempt to connect.

Operator response

If you are not using AT-TLS for this connection, save the Advisor syslogd file and contact the system programmer. If you are using AT-TLS for this connection, take the action appropriate for the reason as follows:

reason action

- 2 Start the Policy Agent if it is not already started. If the AT-TLS policy for the Advisor connections has changed, refresh the Policy Agent. If the problem is not corrected, save the Advisor syslogd file, the AT-TLS syslogd file, and the policy agent syslogd file, then contact the system programmer.

7

If the storage problem cannot be corrected, save the Advisor syslogd file. If a dump was not created, take a dump of the Advisor address space, then contact the system programmer.

All other reasons

Save the system console, the Advisor syslogd file, the AT-TLS syslogd file, and the policy agent syslogd file, then contact the system programmer.

See [z/OS Communications Server: IP Diagnosis Guide](#) for information about collecting diagnostic data.

System programmer response

If you are not using AT-TLS, examine the Advisor syslogd file for errors. Correct the configuration file as needed. See [z/OS Communications Server: IP Configuration Reference](#) for information about configuring the [Advisor and Agent](#) and [ADNR application](#).

If you are using AT-TLS for this connection, take action appropriate for the reason as follows:

1

Activate AT-TLS with the TCPCONFIG TTLS configuration statement. Either correct and resubmit the original TCP/IP profile or submit a VARY TCPIP,,OBEYFILE command. See the information about the TCPCONFIG in [z/OS Communications Server: IP Configuration Reference](#) for more information about the TTLS parameter.

2

If the Policy Agent is active and has been refreshed since the last change to the AT-TLS policy, examine the system console, the Advisor syslogd file, the AT-TLS syslogd file, and the policy agent syslogd file for errors. Correct the AT-TLS policy for this connection. See the information about [Diagnosing Application Transparent Transport Layer Security \(AT-TLS\)](#) in [z/OS Communications Server: IP Diagnosis Guide](#) and [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#). Refresh the Policy Agent after changing the policy.

3

Change the AT-TLS policy for this connection in the TTLSGroupAction statement to TTLSEnabled On. See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#). Refresh the Policy Agent after changing the policy.

4

Change the AT-TLS policy for this connection in the TTLSEnvironmentAdvancedParms statement to ApplicationControlled On for the server (Advisor). See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#). Refresh the Policy Agent after changing the policy.

5

Correct the TLS handshake parameters in the AT-TLS policy for this connection.

- See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#). Refresh the Policy Agent after changing the policy. For example,
 - Ensure that the HandshakeTimeout value for the Advisor policy is sufficient (for example, 30 seconds)
 - Ensure that the HandshakeRole value for the Advisor is ServerWithClientAuth or Server.
 - Ensure that the HandshakeRole value for the Agent and load balancers is Client.

6

Ensure that the user ID has at least read access to the correct SERVAUTH class profile (EZB.LBA.LBACCESS.sysname.tcpsysplexgroupname for a load balancer connection, EZB.LBA.AGENTACCESS.sysname.tcpsysplexgroupname for an Agent connection). For more information, see [z/OS Security Server RACF Command Language Reference](#).

7

If the storage problem cannot be corrected, contact IBM software support services with all supporting documentation. The application syslogd file is the minimum diagnostic data that should be provided. See [z/OS Communications Server: IP Diagnosis Guide](#) for information about collecting diagnostic data.

- 8 Examine the system console, the Advisor syslogd file, the AT-TLS syslogd file, and the policy agent syslogd file for errors. Ensure that the certificate is correct. For more information, see [z/OS Security Server RACF Command Language Reference](#). If the problem is not corrected, contact IBM software support services with all supporting documentation. See [z/OS Communications Server: IP Diagnosis Guide](#) for information about collecting diagnostic data.
- 9 Define and permit the LBACCESS and AGENTACCESS profiles on each system where the Advisor can run. Ensure that the user ID has at least read access to the correct SERVAUTH class profile (EZB.LBA.LBACCESS.sysname.tcpsysplexgroupname for a load balancer connection, EZB.LBA.AGENTACCESS.sysname.tcpsysplexgroupname for an Agent connection). See the [z/OS Security Server RACF Command Language Reference](#) for information about the RDEFINE (Define General Resource Profile).

Example

```
EZD1280I LBADV AGENT CONNECTION ATTEMPT FROM USER AGENT1 AT IP ADDRESS 192.10.1.1 FAILED REASON CODE 6
```

EZD1281I	TTLS Map CONNID: cid LOCAL: loc_ip..loc_port REMOTE: rem_ip..rem_port JOBNAME: jobname USERID: userid TYPE: type STATUS: stat RULE: rule ACTIONS: grp_act env_act conn_act
----------	--

Explanation

The TCP connection with the specified connection ID (CONNID) matched the specified Application Transparent Transport Layer Security (AT-TLS) rule. This CONNID will be used in all future AT-TLS messages for this connection. The message creation time and owning TCP/IP jobname of the process creating the message are included in the syslog trace prior to the message ID. This message has a syslog priority of INFO and is written to the syslog when AT-TLS trace option INFO (4) or EVENT (8) is specified.

cid is a hexadecimal value that uniquely identifies this TCP connection for the life of the connection.

loc_ip is the local IPv4 or IPv6 address.

loc_port is the local port number.

rem_ip is the remote IPv4 or IPv6 address.

rem_port is the remote port number.

jobname is the job name of the application associated with this connection.

userid is the user ID of the application associated with this connection.

type is the direction of connection initiation for connections using the primary policy mapping method: Inbound if Accepting, Outbound if Connecting. *type* is Secondary if the SecondaryMap method was used in either direction.

stat is the AT-TLS status for the connection. The values for *stat* are:

- Not Enabled if TTLS-enabled in the matching AT-TLS policy is set to OFF.
- Enabled if TTLS-enabled in the matching AT-TLS policy is set to ON.
- Appl Control if ApplicationControlled in the matching AT-TLS policy is set to ON.

rule is the name of the TTLSRule that mapped this connection.

grp_act is the name of the TTLSGroupAction.

env_act is the name of the TTLSEnvironmentAction. If a TTLSEnvironmentAction is not specified on the TTLSRule statement, this value will be *N/A*.

conn_act is the name of the TTLSConnectionAction. If a TTLSConnectionAction is not specified on the TTLSRule statement, this value will be *N/A*.

Procedure name

EZBTLMSG

EZD1282I	TTLS Start GRPID: <i>gid</i> ENVID: <i>eid</i> CONNID: <i>cid</i> event ACTIONS: <i>grp_act</i> <i>env_act conn_act add_data</i>
-----------------	---

Explanation

An Application Transparent Transport Layer Security (AT-TLS) event has been started for the specified connection ID (CONNID). The message creation time and owning TCP/IP job name of the process creating the message are included in the syslog trace prior to the message ID. This message has a syslog priority of DEBUG and is written to the syslog when AT-TLS trace option EVENT (8) or FLOW (16) is specified. Flow messages (EZD1284I) and Event messages (EZD1283I) might follow this message, depending on the trace options chosen.

gid is a hexadecimal value that uniquely identifies the AT-TLS group supporting the connection or SSL environment.

eid is a hexadecimal value that uniquely identifies the AT-TLS environment supporting the connection. If *eid* is 00000000, the event does not apply to a specific environment.

cid is a hexadecimal value that uniquely identifies this TCP connection for the life of the connection. A previously issued message EZD1281I provides additional information about the connection. If *cid* is 00000000, the event does not apply to a specific connection.

event is an AT-TLS event. The start of the following events are reported by this message:

Connection Abend Close

An abend occurred while executing AT-TLS work for the specified connection. The specified connection will be reset and closed.

Connection Close

The specified secure connection is being closed.

Connection Stop

The specified secure connection is being stopped.

Environment Create

The specified AT-TLS environment is being created in the AT-TLS group to support the specified connection.

Environment Delete

The specified AT-TLS environment is no longer needed and is being deleted from the AT-TLS group. If this AT-TLS environment is not linked to a master AT-TLS environment, the corresponding System SSL environment will be closed.

Initial Handshake

The initial SSL handshake process is beginning for the specified connection.

Reset Cipher Request

A request to renegotiate the cipher is being processed.

Reset Session Request

A request to reset the session is being processed.

Reset Write Cipher Request

A request to update the connection's key is being processed (TLSv1.3 only).

Send Session Ticket

A request to send a single session ticket to the client is being processed (TLSv1.3 only).

SSL Control Data Read

Control data, such as handshake or alert data, is being read.

grp_act is the name of the TTLSGroupAction.

env_act is the name of the TTLSEnvironmentAction. If a TTLSEnvironmentAction is not specified on the TTLSRule statement or if the event is not environment or connection related, this value will be *N/A*.

conn_act is the name of the TTLSConnectionAction. If a TTLSConnectionAction is not specified on the TTLSRule statement or if the event is not connection related, this value will be *N/A*.

add_data is additional information traced with the following events:

Connection Abend Close

The abend code.

Initial Handshake

The handshake role and, if handshake role is ServerWithClientAuth, the client authentication type.

System action

None.

Operator response

None.

System programmer response

If *event* is **Connection Abend Close**, then contact IBM software support services. If *event* is anything else, then there is no action to be taken.

Module

EZBTLMSG

Procedure name

EZBTLMSG

EZD1283I	TTLS Event GRPID: <i>gid</i> ENVID: <i>eid</i> CONNID: <i>cid</i> RC: <i>rcode</i> event <i>add_data</i>
-----------------	---

Explanation

Application Transparent Transport Layer Security (AT-TLS) has finished the specified event. The message creation time and owning TCP/IP jobname of the process creating the message are included in the syslog trace prior to the message ID. This message has a syslog priority of DEBUG and is written to the syslog when AT-TLS trace option EVENT (8) is specified.

gid is a hexadecimal value that uniquely identifies the AT-TLS group supporting the connection or SSL environment.

eid is a hexadecimal value that uniquely identifies the AT-TLS environment supporting the connection. If the *eid* is 00000000, the event does not apply to a specific environment.

cid is a hexadecimal value that uniquely identifies this TCP connection for the life of the connection. A previously issued message EZD1281I provides additional information about the connection. If the *cid* is 00000000, the event does not apply to a specific connection.

rcode is a System SSL or AT-TLS return code. A value other than zero indicates why the event failed. *rcode* values under 5000 are generated by System SSL and are defined in [z/OS Cryptographic Services System SSL Programming](#). Rcode values over 5000 are generated by AT-TLS and are defined in [Diagnosing Application Transparent Transport Layer Security \(AT-TLS\) in z/OS Communications Server: IP Diagnosis Guide](#).

event is an AT-TLS event. Possible values are:

Connection Abend Close

An abend occurred while executing AT-TLS work for the specified connection. The specified connection will be reset and closed.

Connection Close

The specified secure connection was closed.

Connection Init

A secure connection was initiated for the specified connection.

Connection Stop

The specified secure connection was stopped.

Data Decryption

Application data was decrypted by System SSL.

Environment Close

The specified AT-TLS environment was deleted. The corresponding System SSL environment was closed.

Environment Init

A System SSL environment was initialized for the specified AT-TLS environment.

Environment Link

The specified newly created AT-TLS environment could use an existing System SSL environment. The new AT-TLS environment was linked to a master AT-TLS environment that represents a single System SSL environment.

Environment Link Delete

The specified linked AT-TLS environment was no longer needed. It was linked to a master AT-TLS environment. The AT-TLS environment and its link were deleted. If this was the last AT-TLS environment linked to the master AT-TLS environment, the master was also deleted and the corresponding System SSL environment will be closed.

Environment Master Close

The specified master AT-TLS environment no longer had any linked AT-TLS environments. The corresponding System SSL environment was closed.

Environment Master Create

The specified newly created AT-TLS environment could be linked to a master AT-TLS environment. The master AT-TLS environment did not exist yet and was created. The master AT-TLS environment corresponds to a single System SSL environment.

Environment Master Delete

The specified master AT-TLS environment was no longer needed and was deleted from the AT-TLS group. The corresponding System SSL environment will be closed.

Environment Master Init

A System SSL environment was initialized for the specified master AT-TLS environment.

Initial Handshake

The initial SSL handshake process was completed for the specified connection.

Messages Dropped

Syslog messages were dropped as a result of an excessive backlog of messages to be logged.

Policy Mapping

Policy map was attempted for the specified connection.

Received FIN

A TCP header with the FIN flag turned on was received on the secure connection.

Received Reset

A TCP header with the Reset flag turned on was received on the secure connection. The connection is closed.

Reset Cipher Request

A request to renegotiate the cipher was processed.

Reset Ignored

A TCP header with the Reset flag turned on was received in a response to an SSL close alert. The reset has been ignored.

Reset Session Request

A request to reset the SSL session ID was processed.

Reset Write Cipher Request

A request to update the connection's key is being processed (TLSv1.3 only).

Send Session Ticket

A request to send a single session ticket to the client is being processed (TLSv1.3 only).

SSL Control Data Read

Control data, such as handshake or alert data, was read.

add_data is additional information traced with the following events:

Connection Abend Close

- The handle of the System SSL connection block.
- The handle of the System SSL environment, if used by the connection.
- The abend code.

Connection Close

- The handle of the System SSL connection block.
- The handle of the System SSL environment, if used by the connection.

Data Decryption

The handle of the System SSL connection block.

Environment Close

The handle of the System SSL environment representing the AT-TLS environment.

Environment Init

The handle of the System SSL environment representing the AT-TLS environment.

Environment Link

- The handle of the System SSL environment that represents the master AT-TLS environment.
- The master AT-TLS environment ID.

Environment Link Delete

- The handle of the System SSL environment that represents the master AT-TLS environment.
- The master AT-TLS environment ID.

Environment Master Close

The handle of the System SSL environment representing the master AT-TLS environment.

Environment Master Create

The AT-TLS environment ID just created that necessitates creation of this master AT-TLS environment.

Environment Master Delete

The handle of the System SSL environment representing the master AT-TLS environment.

Environment Master Init

The handle of the System SSL environment representing the master AT-TLS environment.

Initial Handshake

- The handle of the System SSL connection block.
- The handle of the System SSL environment used by the connection.
- The security protocol used by the secure connection.
- The cipher used by the secure connection.
- The key share group used by the secure connection for TLSv1.3 only. Otherwise, the value is 0.

Messages Dropped

The number of messages that were dropped.

Received FIN

The number of bytes of encrypted data on the AT-TLS receive queue when the FIN was received.

Reset Cipher Request

- The handle of the System SSL connection block.
- The handle of the System SSL environment used by the connection.

Reset Session Request

- The handle of the System SSL connection block.
- The handle of the System SSL environment used by the connection.

SSL Control Data Read

- The handle of the System SSL connection block.
- The handle of the System SSL environment used by the connection.

System action

None.

Operator response

None.

System programmer response

System Programmer response varies by event type:

If *event* is **Connection Abend Close**, then contact IBM software support services. For all other *event* values, if *rcode* has a value other than zero, use it to determine the cause of the error and correct if necessary. See [z/OS Communications Server: IP Diagnosis Guide](#) for more information.

Module

EZBTLMSG

Procedure name

EZBTLMSG

EZD1284I	TTLS Flow GRPID: <i>gid</i> ENVID: <i>eid</i> CONNID: <i>cid</i> RC: <i>rcode</i> action <i>func_or_parm</i>- <i>add_data</i>
-----------------	--

Explanation

Application Transparent Transport Layer Security (AT-TLS) called System SSL to perform the specified action on the specified function or parameter. The message creation time and owning TCP/IP job name of the process creating the message are included in the syslog trace prior to the message ID. This message has a syslog priority of DEBUG and is written to the syslog when AT-TLS trace option FLOW (16) is specified. Flow messages might follow the Start message and precede Event messages, depending on the trace options chosen.

gid is a hexadecimal value that uniquely identifies the AT-TLS group supporting the connection or SSL environment.

eid is a hexadecimal value that uniquely identifies the AT-TLS environment supporting the connection. If the *eid* is 00000000, the event does not apply to a specific environment.

cid is a hexadecimal value that uniquely identifies this TCP connection for the life of the connection. A previously issued message EZD1281I provides additional information about the connection. If the *cid* is 00000000, the event does not apply to a specific connection.

rcode is a System SSL or AT-TLS return code. A value other than zero indicates why the event failed. *rcode* values under 5000 are generated by System SSL and are defined in [z/OS Cryptographic Services System SSL Programming](#). *rcode* values over 5000 are generated by AT-TLS and are defined in [Diagnosing Application Transparent Transport Layer Security \(AT-TLS\)](#) in [z/OS Communications Server: IP Diagnosis Guide](#).

action is the action that was taken. Possible values are:

Call

Call a System SSL function.

Get

Get a System SSL parameter value.

Set

Set a System SSL parameter value.

func_or_parm is the name and enumeration value of the System SSL function that was called or the System SSL parameter whose value was set or retrieved. See [z/OS Cryptographic Services System SSL Programming](#) for more information about System SSL functions and parameters.

add_data is additional information traced with the following actions:

Call

The System SSL handle for the Environment or Connection processed by the called function.

Get

The value received for the parameter on the Get.

Set

The value specified for the parameter on the Set.

System action

None.

Operator response

None.

System programmer response

If *rcode* has a value other than zero, use it to determine the cause of the error and correct if necessary. See [z/OS Communications Server: IP Diagnosis Guide](#) for more information.

Set GSK_KEYRING_FILE(201) - ibmuser_ring
```

EZD1285I**TTLS Data CONNID: *cid* *dir* Cipher data****Explanation**

Application Transparent Transport Layer Security (AT-TLS) has sent or received non-application data on the specified connection. The message creation time and owning TCP/IP jobname of the process creating the message are included in the syslog trace prior to the message ID. This message has a syslog priority of DEBUG and is written to syslog when AT-TLS trace option DATA (32) is specified.

cid is a hexadecimal value that uniquely identifies this TCP connection for the life of the connection. A previously issued message EZD1281I provides additional information about the connection. If the *cid* is 00000000, the event does not apply to a specific connection.

dir is either of the following:

Recv

AT-TLS has received data from the network on the connection.

Send

AT-TLS is sending data to the network on the connection.

data is the System SSL control data being transferred.

Module

EZBTLMMSG

Procedure name

EZBTLMMSG

EZD1286I	TTLS Error GRPID: <i>gid</i> ENVID: <i>eid</i> CONNID: <i>cid</i> LOCAL: <i>loc_ip</i>..<i>loc_port</i> REMOTE: <i>rem_ip</i>..<i>rem_port</i> JOBNAME: <i>jobname</i> USERID: <i>userid</i> RULE: <i>rule</i> RC: <i>rcode</i> event
-----------------	--

Explanation

Application Transparent Transport Layer Security (AT-TLS) detected an error during the specified AT-TLS event. The message creation time and owning TCP/IP job name of the process creating the message are included in the syslog trace prior to the message ID. This message has a syslog priority of ERROR and is written to the syslog when AT-TLS trace option ERROR (2) is specified.

In the message text:

gid

The hexadecimal value that uniquely identifies the AT-TLS group supporting the connection or SSL environment.

eid

The hexadecimal value which uniquely identifies the AT-TLS environment supporting the connection. If the *eid* is 00000000, the event does not apply to a specific environment.

cid

The hexadecimal value which uniquely identifies this TCP connection for the life of the connection. A previously issued message EZD1281I provides additional information about the connection. If the *cid* is 00000000, the event does not apply to a specific connection.

loc_ip

The local IPv4 or IPv6 address.

loc_port

The local port number.

rem_ip

The remote IPv4 or IPv6 address.

rem_port

The remote port number.

jobname

The job name of the application associated with this connection.

userid

The user ID of the application associated with this connection.

rule

The name of the TTLSRule statement that mapped this connection.

rcode

The System SSL or AT-TLS return code that indicates why the event failed. *rcode* values under 5000 are generated by System SSL and are defined in [z/OS Cryptographic Services System SSL Programming](#). *rcode*

values over 5000 are generated by AT-TLS and are defined in [AT-TLS return codes](#) in [z/OS Communications Server: IP Diagnosis Guide](#).

event

The AT-TLS event that was in process when the error occurred. Possible values are:

Connection Abend Close

An abend occurred while executing AT-TLS work for the specified connection.

Connection Close

The specified secure connection was being closed.

Connection Init

A secure connection was being initiated for the specified connection.

Connection Stop

The specified secure connection was being stopped.

Data Decryption

Application data was being decrypted by System SSL.

Data Encryption

Application data was being encrypted by System SSL.

Environment Close

The specified AT-TLS environment was being deleted and the corresponding System SSL environment was being closed.

Environment Init

A System SSL environment was being initialized for the specified AT-TLS environment.

Environment Link

The specified newly created AT-TLS environment could use an existing System SSL environment. The new AT-TLS environment was being linked to a master AT-TLS environment that represents a single System SSL environment.

Environment Link Delete

The specified linked AT-TLS environment was no longer needed. It was linked to a master AT-TLS environment. The AT-TLS environment and its link were being deleted. If this is the last AT-TLS environment linked to the master AT-TLS environment, the master was also being deleted and the corresponding System SSL environment will be closed.

Environment Master Close

The specified master AT-TLS environment no longer had any linked AT-TLS environments. The corresponding System SSL environment was being closed.

Environment Master Create

The specified newly created AT-TLS environment could be linked to a master AT-TLS environment. The master AT-TLS environment did not exist yet and was being created. A master AT-TLS environment corresponds to a single System SSL environment.

Environment Master Delete

The specified master AT-TLS environment was no longer needed and was being deleted from the AT-TLS group. The corresponding System SSL environment will be closed.

Environment Master Init

A System SSL environment was being initialized for the specified master AT-TLS environment.

HandshakeTimeout Expired

A secure connection was being initialized, but did not complete in the HandshakeTimeout interval.

Initial Handshake

The initial SSL handshake was in process for the connection.

Policy Mapping

Policy was being mapped for the specified connection.

Reset Cipher Request

A request to renegotiate the cipher was being processed.

Reset Session Request

A request to reset the session was being processed.

Reset Write Cipher Request

A request to update the connection's key is being processed (TLSv1.3 only).

Send Session Ticket

A request to send a single session ticket to the client is being processed (TLSv1.3 only).

SSL Control Data Read

Control data, such as handshake or alert data, was being read.

System action

None.

Operator response

None.

System programmer response

Use the *rcode* value to determine the cause of the error and correct if necessary. See [z/OS Communications Server: IP Diagnosis Guide](#) for more information.

Module

EZBTLMSG

Example

```
EZD1286I TTLS Error GRPID: 00000001 ENVID: 00000001 CONNID: 0000001F LOCAL: 9.42.104.171..1025
REMOTE: 9.42.104.171..6003 JOBNAME: USER603 USERID: USER60 RULE: tnsaso_clnt6 RC: 5006
Initial Handshake 00000000 00000000
```

Procedure name

EZBTLMSG

```

Procedure name

EZBTLMSG

EZD1288I	<i>Tcpname</i> AT-TLS GROUP <i>group_name</i> INITIALIZATION FAILED - <i>reason</i>
-----------------	--

Explanation

The initialization of the AT-TLS GROUP *group_name* did not complete successfully because of the *reason* specified.

In the message text:

Tcpname

The name of the TCPIP stack

group_name

The name of the AT-TLS group specified on a TTLSGroupAction statement

reason

Additional information about why the initialization of the group failed. *reason* is one of the following:

ICSF UNAVAILABLE FOR FIPS140 MODE GROUP – ICSF was not active when *tcpname* initialized the AT-TLS group *group_name*, which is configured with FIPS140 On. ICSF is required for FIPS140 support.

System action

TCPIP continues. The AT-TLS group *group_name* is marked as failed. Any connections attempting to use that group will be reset. AT-TLS sets a return code of 5018 for those connections.

Operator response

Contact the system programmer.

System programmer response

Use the *reason* to resolve the initialization failure.

For *reason* ICSF UNAVAILABLE FOR FIPS140 MODE GROUP:

- If the AT-TLS group needs to be FIPS140 enabled, start ICSF before installing the AT-TLS policy. To attempt starting the AT-TLS group again after ICSF is active, refresh the AT-TLS policy as described in [Action refresh](#) in [z/OS Communications Server: IP Configuration Guide](#).
- If the AT-TLS group does not need to be FIPS140 enabled, specify FIPS140 Off on the TTLSGroupAction statement. Refresh the AT-TLS policy as described in [Action refresh](#) in [z/OS Communications Server: IP Configuration Guide](#).

User response

None.

Problem determination

Example

EZD1289I TCPCS ICSF SERVICES ARE CURRENTLY AVAILABLE FOR AT-TLS GROUP grp_act1	
EZD1290I	<i>Tcpname</i> ICSF SERVICES ARE CURRENTLY UNAVAILABLE FOR AT-TLS GROUP <i>group_name</i>

Explanation

AT-TLS is starting AT-TLS group *group_name* and ICSF is not active. ICSF services are not available for the AT-TLS group. This includes access to the cryptographic hardware, certificate keys stored in ICSF, Elliptical Curve Cryptography, and AES-GCM ciphers.

In the message text:

Tcpname

The name of the TCPIP stack

group_name

The name of the AT-TLS group specified on a TTLSGroupAction statement

System action

Processing continues.

Operator response

Contact the system programmer.

System programmer response

If ICSF is not being used, no response is required. If ICSF services are required, the AT-TLS group must be restarted when ICSF is available. After ICSF is active, refresh the AT-TLS policy as described in [Action refresh](#) in [z/OS Communications Server: IP Configuration Guide](#).

EZD1290I TCPCS ICSF SERVICES ARE CURRENTLY UNAVAILABLE FOR AT-TLS GROUP grp_act1
```

EZD1291I **Active EXPLICITBINDPORTRANGE changed to *begin_port* - *end_port* by *tcp_name* on *mvs_name***

Explanation

The explicit bind port range, used to coordinate sysplex port allocation across the sysplex for applications issuing bind INADDR_ANY and IN6ADDR_ANY with port 0, has been changed by the specified stack on the specified MVS system.

This message is displayed only on the MVS system for the stack that caused the range to change.

In the message text:

begin_port

The first port in the new range.

end_port

The last port in the new range.

tcp_name

The name of the TCP/IP stack that caused the port range to change.

mvs_name

The name of the MVS system on which the TCP/IP stack is running.

System action

TCP/IP processing continues. Explicit bind sysplex ports will be allocated from the new range.

Operator response

6

Example

```
EZD1291I Active EXPLICITBINDPORTRANGE changed to 06000 - 06999 by TCP1 on MVS1
```

EZD1292I**No active EXPLICITBINDPORTRANGE is available from this stack****Explanation**

This message is issued in response to a DISPLAY TCPIP,*tcpname*,SYSPLEX,PORTS command. The active explicit bind port range is not available to be displayed from this stack either because explicit bind port range processing is not enabled for this stack or this stack does not have access to the sysplexports coupling facility structure.

System action

TCP/IP continues

Operator response

Issue the DISPLAY TCPIP,*tcpname*,SYSPLEX,PORTS command, specifying a stack that has explicit bind port range processing enabled, or issue a DISPLAY NET,STATS,TYPE=CFS,STRNAME=*sysplexports_structure_name* command on a VTAM node that is connected to the sysplexports structure. See the information about the GLOBALCONFIG statement in [z/OS Communications Server: IP Configuration Reference](#) for information about enabling the EXPLICITBINDPORTRANGE parameter. See the information about the IPCONFIG statement information in [z/OS Communications Server: SNA Operation](#) for information about displaying sysplexport structure data.

EZD1293I	Configured EXPLICITBINDPORTRANGE: <i>begin_port</i> - <i>end_port</i>
-----------------	--

Explanation

This message is issued in response to a DISPLAY TCPIP,*tcpname*,SYSPLEX,PORTS command. It displays the explicit bind port range configured by specifying EXPLICITBINDPORTRANGE on the GLOBALCONFIG statement. The explicit bind port range configured on this stack might not be the range that is actively in use for allocating explicit bind sysplexports. Message EZD1294I displays the currently active explicit bind port range. See the information about the [GLOBALCONFIG statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about specifying the EXPLICITBINDPORTRANGE parameter.

In the message text:

begin_port

The first port in the configured explicit bind port range.

end_port

The last port in the configured explicit bind port range.

System action

TCP/IP processing continues.

Example

EZD1293I Configured EXPLICITBINDPORTRANGE: 06000 - 06999

EZD1294I Active EXPLICITBINDPORTRANGE: *begin_port* - *end_port*

Explanation

This message is issued in response to a DISPLAY TCPIP,*tcpname*,SYSPLEX,PORTS command. It displays the explicit bind port range that is actively in use in the sysplex (or subplex) that allocates explicit bind sysplexports.

In the message text:

begin_port

The first port in the active explicit bind port range.

end_port

The last port in the active explicit bind port range.

System action

TCP/IP continues.

Operator response

If the active explicit bind port range does not match the configured range for this stack (displayed in message [EZD1293I](#)), contact the system programmer.

System programmer response

Configure the same explicit bind port range on all the TCP/IP stacks that participate in explicit bind port range processing in the sysplex (or subplex). See the information about the [GLOBALCONFIG](#) statement in [z/OS Communications Server: IP Configuration Reference](#) for information about how to coordinate explicit bind port range configuration across stacks in the sysplex.

User response

Example

```
EZD1294I Active EXPLICITBINDPORTRANGE: 06000 - 06999
```

EZD1295I**No EXPLICITBINDPORTRANGE is configured on this stack**

Explanation

This message is issued in response to a `DISPLAY TCPIP,tcpname,SYSPLEX,PORTS` command. The explicit bind port range is not configured on this stack, either because no `GLOBALCONFIG` statement was processed that specified the `EXPLICITBINDPORTRANGE` parameter, or a `GLOBALCONFIG` statement with the `NOEXPLICITBINDPORTRANGE` parameter was processed.

System action

TCP/IP continues.

Operator response

If you want this stack to participate in explicit bind port range processing, contact the system programmer.

System programmer response

See the information about the [GLOBALCONFIG](#) statement in *z/OS Communications Server: IP Configuration Reference* for information about enabling the EXPLICITBINDPORTRANGE option.

User response

Source

z/OS Communications Server TCP/IP

Module

EZBXFIO2

Routing code

Not applicable.

Descriptor code

Not applicable.

Example

Not applicable.

EZD1296I**EXPLICITBINDPORTRANGE exhausted**

Explanation

There are no more ports available in the active range to be allocated for explicit bind port range processing. This message indicates that the explicit bind port range is too small to accommodate all the applications that issue bind requests to INADDR_ANY and IN6ADDR_ANY and port 0. This message is issued only once every 5 minutes when the TCP/IP stack attempts to allocate a new port from the explicit bind port range and finds that no ports are available. Display the active explicit bind port range by issuing a `DISPLAY TCPIP,,SYSPLEX,PORTS` command. See the information about [DISPLAY TCPIP,,SYSPLEX](#) in *z/OS Communications Server: IP System Administrator's Commands*.

System action

TCP/IP continues. Applications that issue bind requests to INADDR_ANY and IN6ADDR_ANY , port 0 on this stack will have their subsequent connections fail if a distributed DVIPIA is chosen as a source IP address.

Operator response

Contact the system programmer.

System programmer response

Either extend the active explicit bind port range or configure a new explicit bind port range with enough ports to accommodate the way the range is used in your sysplex (or subplex). The increase in size for the range should be at least 64 times the number of TCP/IP stacks configured with the GLOBALCONFIG

EXPLICITBINDPORTRANGE option in the sysplex (or subplex). For example, if your current range is 06000–06639 and you have five TCP/IP stacks configured with the GLOBALCONFIG EXPLICITBINDPORTRANGE statement, you probably want to increase the range by 320 ports to 06000–06959. See the information about the GLOBALCONFIG statement in [z/OS Communications Server: IP Configuration Reference](#) for information about setting the EXPLICITBINDPORTRANGE statement. See the information about [diagnosing network security services \(NSS\) server problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for information about how to determine a range for explicit bind ports.

12

Automation

This is a system console message. You might automate on this message to determine when the EXPLICITBINDPORTRANGE is exhausted, so that you can extend the range, as described in the System Programmer Response.

Example

Not applicable.

EZD1297I	<i>tcp_name</i> is unable to set EXPLICITBINDPORTRANGE in the sysplexports structure
-----------------	---

Explanation

An attempt to set the explicit bind port range in the sysplexports coupling facility structure failed. This attempt was made during the processing of a GLOBALCONFIG statement with the EXPLICITBINDPORTRANGE parameter specified. The failure might be caused by a loss of access to the sysplexports structure, either as a result of a structure rebuild or a structure disconnect.

In the message text:

tcp_name
The name of the TCP/IP stack.

System action

TCP/IP processing continues. No explicit bind port range processing is performed on this stack.

Operator response

In the console log, check for any failure or rebuild messages referencing the sysplexports structure (the sysplexports structure name will be in the format EZBEPOR vv tt , where the vv value is the VTAM XCF group ID specified as a VTAM start option and the tt value is the TCP XCF group ID specified in the TCP profile on the GLOBALCONFIG statement.) If a structure rebuild was in process for the sysplexports structure used by this stack, wait for the rebuild to complete and issue a VARY TCPIP,,OBEYFILE command specifying a file containing the GLOBALCONFIG EXPLICITBINDPORTRANGE statement. If VTAM lost connectivity to the structure, issue the VARY NET,CFS,ACTION=CONNECT,STRNAME=*structure_name* command to re-establish connectivity to the structure. When connectivity is re-established, issue a VARY TCPIP,,OBEYFILE command specifying a file containing the GLOBALCONFIG EXPLICITBINDPORTRANGE statement. If neither of the previous conditions are true, contact the system programmer.

System programmer response

Take a dump of TCP stack address space, the VTAM address space, and the sysplexports structure and contact the IBM Software Support Center.

```

EZD1299I

**VIPADISTRIBUTE *keyword* IS NOT VALID BECAUSE THE CURRENT
DISTRIBUTION METHOD IS NOT SERVERWLM**

Explanation

The DISTMETHOD keyword was not specified on the VIPADISTRIBUTE statement that is being processed. Either the distribution method was set to the default value BASEWLM, or a previous VIPADISTRIBUTE statement for the same DVIPA and port defined a distribution method other than SERVERWLM. The specified keyword is valid only when the distribution method is SERVERWLM.

This message appears only in the system log and is preceded by either message EZZ8469I or message EZZ8470I, which identifies the VIPADISTRIBUTE definition.

In the message text:

keyword

The keyword on the VIPADISTRIBUTE profile statement.

System action

TCP/IP continues. The VIPADISTRIBUTE statement with the keyword that is not valid is ignored.

Operator response

Contact the system programmer.

System programmer response

Remove the incorrect VIPADISTRIBUTE statement from the VIPADYNAMIC block, or correct the VIPADISTRIBUTE statement by deleting the parameter and keyword that is not valid, or by adding the DISTMETHOD parameter with the value SERVERWLM to change the distribution method. Then issue a VARY TCPIP,,OBEYFILE command with an obey file that contains the corrected VIPADYNAMIC block. See the information about the [VIPADYNAMIC statement summary](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information.

SERVERWLM
```

EZD1300I**TIER PARAMETER DOES NOT MATCH VIPADEFINE**

Explanation

This message contains additional information for message EZZ8469I or EZZ8471I. The VIPADISTRIBUTE statement and the corresponding VIPADEFINE statement for this DVIPA must have the same TIER parameter value (either TIER1, TIER2, or not specified), but the TIER parameter values do not match.

System action

TCP/IP continues. The VIPADISTRIBUTE statement is rejected.

Operator response

Contact the system programmer.

System programmer response

Issue the Netstat VIPADCFG/-F command to determine which DVIPAs are configured on this stack.

If the VIPADISTRIBUTE statement was incorrect, change that statement in a VARY TCPIP,,OBEYFILE data set to specify the appropriate TIER parameter value. If the VIPADEFINE statement was incorrect, specify a VIPADELETE statement for the DVIPA in a data set that is referenced by a VARY TCPIP,,OBEYFILE command, followed by a VIPADEFINE statement for that DVIPA that specifies the appropriate TIER parameter. Also, to delete any existing VIPADISTRIBUTE DEFINE statements that reference this DVIPA, include the VIPADISTRIBUTE DELETE statements before the VIPADELETE statement in the data set.

See the information about the [VIPADYNAMIC statement summary](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the VIPADISTRIBUTE profile statement.

Module

EZBXFDV2

Routing code

2,8

Descriptor code

12

Automation

Not applicable.

Example

Not applicable.

Explanation

This message contains additional information for message EZZ8469I. A VIPADISTRIBUTE DEFINE statement appears in a TCP/IP profile or VARY TCPIP,,OBEYFILE data set. The VIPA that it references is defined with the CPCSCOPE parameter, but without the TIER2 parameter. These DVIPAs cannot be distributed.

System action

TCP/IP continues. The VIPADISTRIBUTE statement is rejected.

Operator response

Contact the system programmer.

System programmer response

Issue the Netstat VIPADCFG/-F command to determine which DVIPAs are configured on this stack.

If the VIPADISTRIBUTE DEFINE statement was incorrect, change that statement in a VARY TCPIP,,OBEYFILE data set to use a DVIPA that does not specify the CPCSCOPE parameter or that specifies the CPCSCOPE and TIER2 parameters. If the VIPADEFINE statement was incorrect, specify a VIPADELETE statement for the DVIPA, followed by a VIPADEFINE statement for that DVIPA that does not specify the CPCSCOPE parameter or that specifies the CPCSCOPE and TIER2 parameters.

See the information about the [VIPADYNAMIC statement summary](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the VIPADISTRIBUTE profile statement.

DVIPA *ipaddr* WITH CPCSCOPE IS ALREADY DEFINED ON A DIFFERENT CPC

Explanation

A DVIPA was defined by a VIPADEFINE or a VIPABACKUP statement in a TCP/IP profile or in a VARY TCPIP,,OBEYFILE data set with the CPCSCOPE parameter specified, but that DVIPA has already been defined on a different central processor complex (CPC). Definitions of CPCSCOPE DVIPAs must remain within a CPC.

In the message text:

ipaddr

The IP address specified on the VIPADEFINE or VIPABACKUP statement.

System action

TCP/IP continues. The VIPADEFINE or VIPABACKUP statement is rejected.

Operator response

Contact the system programmer.

System programmer response

Move the VIPADEFINE or the VIPABACKUP statement to a TCP/IP profile that will be used by a stack that is on the same CPC as the original definition of this DVIPA or issue the VARY TCPIP,,OBEYFILE command for a stack that is on the same CPC as the original definition of this DVIPA.

See the information about the [VIPADYNAMIC](#) statement summary in [z/OS Communications Server: IP Configuration Reference](#) for more information about the VIPADEFINE and VIPABACKUP profile statements.

User response

Example

```
EZD1302I DVIPA 10.61.11.1 WITH CPCSCOPE IS ALREADY DEFINED ON A DIFFERENT CPC
```

EZD1308I	DVIPA <i>ipaddr</i> IS ALREADY DEFINED WITH DIFFERENT TIER1, TIER2 OR CPCSCOPE PARAMETER
-----------------	---

Explanation

A VIPADEFINE or VIPABACKUP statement appears in a TCP/IP profile or VARY TCPIP,,OBEYFILE file with the TIER1, TIER2, or CPCSCOPE parameter specified, but that DVIPA was already defined with a different TIER1, TIER2, or CPCSCOPE parameter specified. This message might also be issued if the VIPADEFINE or VIPABACKUP statement did not specify a TIER1, TIER2, or CPCSCOPE parameter, but the DVIPA was already defined with a TIER1, TIER2, or CPCSCOPE parameter specified.

In the message text:

ipaddr

The IP address specified on the VIPADEFINE or VIPABACKUP statement.

System action

TCP/IP continues. The VIPADEFINE or VIPABACKUP statement is rejected.

Operator response

Contact the system programmer.

System programmer response

If the initial VIPADEFINE or VIPABACKUP statement was incorrect, issue a VIPADELETE statement for the DVIPA, followed by a VIPADEFINE or VIPABACKUP statement for that DVIPA that specifies the appropriate TIER or CPCSCOPE parameter. If the current VIPADEFINE or VIPABACKUP statement is incorrect, change that statement to specify the TIER or CPCSCOPE parameter that is specified on the previous definition, and restart the stack (if the TCP/IP profile was changed) or reissue the VARY TCPIP,,OBEYFILE command.

See the information about the [VIPADYNAMIC](#) statement summary in [z/OS Communications Server: IP Configuration Reference](#) for more information about the VIPADEFINE and VIPABACKUP profile statement.

```
EZD1308I DVIPA 10.60.1.1 IS ALREADY DEFINED WITH DIFFERENT TIER1, TIER2 OR CPCSCOPE PARAMETER
```

EZD1310I *tcp_name* **DISCARDED INBOUND SYSPLEX DISTRIBUTED PACKETS**

Explanation

An unusually high rate of inbound sysplex-distributed traffic resulted in severe contention for internal TCP/IP resources, as measured by the maximum concurrent service request block (SRB) threshold. TCP/IP discarded inbound sysplex-distributed traffic that is associated with the SRBs that exceeded the threshold to protect the system from exhausting critical resources. This message is issued once per sysplex monitor interval if the concurrent SRB threshold is exceeded. The message is deleted after an entire monitor interval passes without any SRBs exceeding the threshold.

In the message text:

tcp_name

The name of the TCP/IP stack.

System action

TCP/IP continues.

Operator response

Contact the system programmer.

System programmer response

Investigate the cause of the surge in distributed traffic. Contact IBM software support services if the message persists.

User response

```

EZD1312I	HEALTH CHECKER SETUP FAILED FOR <i>resource_name</i> MACRO <i>macro_name</i> RC <i>rtn_code</i> RSN <i>rsn_code</i>
-----------------	--

Explanation

The initialization of support for checks in the IBM Health Checker for z/OS failed for the specified system resource.

In the message text:

resource_name

The name of the system resource associated with the IBM Health Checker for z/OS initialization failure.

- If the failure involves a TCP/IP stack, *resource_name* is the job name of the TCP/IP stack.
- If the failure involves the system resolver, *resource_name* is RESOLVER.

macro_name

The name of the macro that failed. This value is CSVDYNEX or HZSCHECK.

rtn_code

The return code from the failing macro. It is displayed as 2 hexadecimal digits.

rsn_code

The reason code from the failing macro. It is displayed as 4 hexadecimal digits.

System action

The system resource continues initialization. IBM Health Checker for z/OS checks are not performed for the specified system resource.

Operator response

Contact the system programmer.

System programmer response

If the failing macro was CSVDYNEX, look up the *rtn_code* and *rsn_code* values in [CSVDYNEX - Provide dynamic exit services in z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN](#) to determine the cause of the failure. If the failing macro was HZSCHECK, look up the *rtn_code* and *rsn_code* values in the [HZSCHECK macro description in IBM Health Checker for z/OS User's Guide](#) to determine the cause of the failure. When the cause of the failure has been determined, correct the problem and stop and restart the system resource to set up the appropriate checks in IBM Health Checker for z/OS.

```
EZD1312I HEALTH CHECKER SETUP FAILED FOR TCPCS1 MACRO CSVDYNEX RC 0C RSN 0C02
```

EZD1313I **REQUIRED SAF SERVAUTH PROFILE NOT FOUND** *resource_name*

Explanation

TCP/IP denied a request because SAF indicated no decision (return code 4) for the requested resource name in the SERVAUTH class.

In the message text:

resource_name

The fully qualified name of the resource being checked.

System action

TCP/IP denies the request and processing continues.

Operator response

Save the system log and contact the system programmer.

System programmer response

The most likely cause of this error is that no profile was defined for this resource name. If you think that a profile was defined for this resource, ensure that the following are true:

1. RACF (or other SAF compliant security server) was started.
2. The SETROPTS CLASSACT(SERVAUTH) command was issued.
3. The SETROPTS GENERIC(SERVAUTH) command was issued before you defined any profiles that contain the asterisk (*) or percent sign (%) wildcard characters. Profiles entered before this command are not recognized by RACF as generic, but as discrete.
4. The spelling of the intended profile name matches the spelling of the resource name in the message.

5. The SETROPTS RACLIST(SERVAUTH) command was issued or the SETROPTS RACLIST(SERVAUTH) REFRESH command was issued after any changes were made.

```

EZD1314I	TCP/IP AND EXTENDED SERVICES ARE NOW INITIALIZED FOR STACK: <i>tcpstackname</i>
-----------------	---

Explanation

This message is issued when initialization of the TCP/IP stack and other extended stack services such as Sysplex/DVIPA, Policy Agent, and IPsec infrastructure is complete. Since this message represents the complete initialization of the stack, it can be used to automate processes that rely on the stack and its extended services being fully available.

Tip: While this message does not explicitly indicate that OMPROUTE is initialized, you can make it implicitly indicate that OMPROUTE is initialized by configuring GLOBALCONFIG SYSPLEXMONITOR DELAYJOIN. This will prevent the TCP/IP stack from joining the sysplex, and therefore prevent Sysplex/DVIPA initialization, until OMPROUTE is initialized and active.

z/OS Communications Server always waits for the TCP/IP stack and any Sysplex/DVIPA definitions to finish initialization before issuing this message. In addition, z/OS Communications Server waits for initialization of the following extended stack services, if relevant for this TCP/IP stack's configuration:

- Policy Agent initialization

The user can configure GLOBALCONFIG POLICYREQUIRED in the TCP/IP profile to indicate whether the TCP/IP stack should monitor Policy Agent initialization or not. By default, if AT-TLS is enabled (that is, TCPCONFIG TTLS is configured), the TCP/IP stack monitors Policy Agent initialization. See the description of POLICYREQUIRED in [z/OS Communications Server: IP Configuration Reference](#).

- IPsec infrastructure initialization

The user can configure GLOBALCONFIG IKEDREQUIRED in the TCP/IP profile to indicate whether the TCP/IP stack should monitor the initialization of the IPsec infrastructure or not. By default, if IPCONFIG IPSECURITY

is configured and at least one type of traffic is being protected with an IPSec tunnel, the TCP/IP stack monitors the initialization of the IPSec infrastructure. See the description of the IKEDREQUIRED parameter on the GLOBALCONFIG statement in [z/OS Communications Server: IP Configuration Reference](#).

In the message text:

tcpstackname

The name of the started task associated with the TCP/IP address space.

System action

Normal stack initialization processing.

Operator response

None.

System programmer response

No action is needed.

User response

None.

Problem determination

Not applicable.

Module

EZBXFUT7

Routing code

2, 8

Descriptor code

12

Automation

This message goes to the console. You might want to use this message for automation because the message is intended to indicate when all dependent stack services are fully initialized (you choose which services are important). For example, you might want to start an application that relies on IPSec infrastructure, and by automating on the startup message you can be certain that the IPSec infrastructure has already been initialized and is ready.

Example

```
EZD1314I TCP/IP AND EXTENDED SERVICES ARE NOW INITIALIZED FOR STACK: TCPCS
```

EZD1315E

**NOTIFICATION OF TCP/IP EXTENDED SERVICES AVAILABILITY IS
DELAYED FOR *tcpstackname* DUE TO *extended_service***

Explanation

Message EZD1314I is issued when initialization of the TCP/IP stack and other extended stack services such as Sysplex/DVIPA, Policy Agent, and IPsec infrastructure is complete. An ENF80 signal is also generated.

For more information about the ENF80 signal, see [Using ENF event code 80 to notify applications of complete initialization of the TCP/IP stack and extended services](#) in *z/OS Communications Server: IP Programmer's Guide and Reference*.

EZD1315E identifies an extended service that is delaying this notification.

In the message text:

tcpstackname

The name of the started task that is associated with the TCP/IP address space.

extended_service

The possible values are:

SYSPLEX

The TCP/IP stack has not joined the Sysplex group or has not completed processing Sysplex/DVIPA definitions within the profile (VIPADYNAMIC and IPCONFIG/IPCONFIG6 DYNAMICXCF statements).

PAGENT

Policy Agent has not completed installation of all local and/or remote policies.

IPSEC INFRASTRUCTURE

The Internet Key Exchange (IKE) daemon has not indicated that the IPsec infrastructure, including Policy Agent, IKED, and NSSD (if configured) is active.

System action

Normal stack initialization processing continues.

Operator response

If message EZD1315E indicates that notification is delayed due to SYSPLEX, verify that message EZD1176I has been generated on the console to indicate completion of Sysplex/DVIPA initialization and joining of the Sysplex group. If EZD1176I has been generated and EZD1315E remains, contact the system programmer.

If message EZD1315E indicates that notification is delayed due to PAGENT, verify that the Policy Agent is active. If it is active and EZD1315E message remains, contact the system programmer.

If message EZD1315E indicates that notification is delayed due to IPSEC INFRASTRUCTURE, verify that the Policy Agent, IKED, and NSSD (if configured) are active. Determine if IKED has generated an EZD2050I message indicating that it has detected a specific problem with the infrastructure. The IKE daemon writes messages to syslogd using the local4 facility. If Policy Agent, IKED, and NSSD (if configured) are active and no error has been reported by IKED, contact the system programmer if this message remains.

System programmer response

See [Diagnosing TCP/IP stack initialization problems](#) in *z/OS Communications Server: IP Diagnosis Guide*.

User response

Not applicable.

Problem determination

See the system programmer response.

Module

12

Automation

This message goes to the console. You might want to use this message for automation because the message is intended to indicate when all dependent stack services are fully initialized (you choose which services are important). For example, you might want to start an application that relies on IPSec infrastructure, and by automating on the startup message you can be certain that the IPSec infrastructure has already been initialized and is ready.

Example

```
EZD1315E NOTIFICATION OF TCP/IP EXTENDED SERVICES AVAILABILITY IS DELAYED FOR TCPCS2 DUE TO SYSPLEX
```

```
EZD1315E NOTIFICATION OF TCP/IP EXTENDED SERVICES AVAILABILITY IS DELAYED FOR TCPCS2 DUE TO PAGENT
```

```
EZD1315E NOTIFICATION OF TCP/IP EXTENDED SERVICES AVAILABILITY IS DELAYED FOR TCPCS2 DUE TO IPSEC  
INFRASTRUCTURE
```

```
EZD1318I                A CONNECTION FROM A client_type CLIENT HAS BEEN REJECTED  
BECAUSE THE NSS SERVER CAN ONLY HANDLE max_client  
CONCURRENT client_type2 CLIENTS
```

Explanation

The network security services daemon (NSSD) has reached the limit of the number of clients that can be supported for a given type of client. No additional connections will be accepted until the number of active connections for the type of client attempting to connect is less than the supported limit.

In the message text:

client_type

The possible values are Network Security Server or Network Management Interface.

max_client

The maximum number of clients of the specified type that the NSSD can service at any time.

client_type2

The same value as the *client_type* value.

System action

The new connection is closed and the server continues with its existing set of clients.

Operator response

Contact the system programmer.

System programmer response

See the information about [NSS server capacity considerations](#) in *z/OS Communications Server: IP Configuration Guide* for more information about the number of NSS server and network management interface clients that a single NSSD instance can support.

User response

Not applicable.

Problem determination

```

EZD1319I

**ERROR (*errno* | *errnojr* | *description*) WHILE OPENING MESSAGE
CATALOG *name* - DEFAULT MESSAGES WILL BE USED**

Explanation

The network security services daemon (NSSD) was unable to open the message catalog. Default messages will be used.

In the message text:

errno

The UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

description

Describes the meaning of the *errno* value.

name

The message catalog file name that the NSSD was attempting to open.

System action

The default message catalog will be used by the NSSD.

Operator response

Contact the system programmer.

System programmer response

Correct the error indicated by the *errno*, *errnojr*, and *description* values. A common cause of this error message is an incorrectly set NSSD_FILE environment variable. See the [Steps for configuring the NSS server in z/OS Communications Server: IP Configuration Guide](#) for information about the NSSD_FILE environment variable.

User response

No action needed.

Problem determination

None.

EZD1322I INTERNAL ERROR IN MODULE *modid* : *errid* | *value1* | *value2* | *value3*

Explanation

The network security services daemon (NSSD) detected an internal error. Additional diagnostic messages might be issued.

In the message text:

modid

An internal identifier that indicates the module that detected the error.

errid

An internal identifier for this error in the detecting module.

value1

Internal error information.

value2

Internal error information.

value3

Internal error information.

System action

Results are unpredictable. One or more address space dumps can be produced with dump titles that match the message text.

Operator response

Contact the system programmer.

System programmer response

Contact IBM software support services and provide a syslog that includes this message. If available, provide CTRACE information for component SYSTCPNS. If available, provide any dumps associated with this message.

User response

Not applicable.

Problem determination

See the system programmer response.

Source

Example

```
EZD1322I INTERNAL ERROR IN MODULE MGRRLSV : 1 | 1 | 121 | 0
```

EZD1323I**CERTIFICATE (*label*) DOES NOT CONTAIN AN ISSUER NAME**

Explanation

A certificate in the network security services (NSS) server certificate repository does not contain an issuer field. The NSS server requires that certificates contain an issuer field as defined in RFC 2459. See [Appendix A, “Related protocol specifications,”](#) on page 1471 for information about accessing RFCs.

In the message text:

label

The certificate repository label that identifies the certificate that did not contain an issuer field.

System action

The certificate is ignored by the network security server daemon.

Operator response

None.

System programmer response

Remove the certificate from the NSS server certificate repository. If this was a certificate to be used on behalf of an NSS client, obtain a new certificate containing an Issuer field.

User response

None.

Problem determination

Not applicable.

Source

z/OS Communications Server TCP/IP: Network Security Server

Module

CertRepository.cpp

Routing code

10

Descriptor code

12

Example

```
EZD1323I CERTIFICATE ( CLIENT1CERT ) DOES NOT CONTAIN AN ISSUER NAME
```

EZD1324I	CERTIFICATE (<i>label</i>) CANNOT BE USED TO CREATE A SIGNATURE AND IS NOT A CERTIFICATE AUTHORITY CERTIFICATE
-----------------	---

Explanation

A certificate in the network security server certificate repository cannot be used to create a digital signature and is not a Certificate Authority certificate. A certificate must contain a private key to be used to create a signature.

If a KeyUsage extension is present in the certificate the digitalSignature bit must be set.

To be a Certificate Authority certificate the certificate must meet one of the following conditions:

- The certificate contains a basic constraints extension that indicates that the subject of this certificate is a Certificate Authority.
- The certificate does not contain a basic constraints extension, but the certificate is marked as trusted in the certificate repository and the issuer name in the certificate is equal to the subject name in the certificate (that is, it is self signed).

In the message text:

label

The certificate repository label identifying the certificate.

System action

The certificate is ignored by the network security services daemon. Processing continues.

Operator response

None.

System programmer response

If this certificate is intended to be used on behalf of a network security services (NSS) client to create a signature, then verify that the private key is stored in the certificate repository. If the private key is not stored in the repository remove the certificate from the repository and add it back to the repository with its private key. If the KeyUsage extension is present in the certificate and the digitalSignature bit is not set, the certificate cannot be used to create a signature. A new certificate must be obtained. If this certificate is intended to be used as a Certificate Authority certificate and it is self-signed, then verify that it is marked as trusted. If it is not self-signed then the certificate cannot be used as a Certificate Authority certificate. A new certificate must be obtained.

User response

None.

Problem determination

Not applicable.

Example

```
EZD1324I CERTIFICATE ( CERTWITHNOKEY ) CANNOT BE USED TO CREATE A SIGNATURE AND IS NOT A  
CERTIFICATE AUTHORITY CERTIFICATE
```

EZD1325I**ERROR PROCESSING CERTIFICATE (*label* | error: *error*)**

Explanation

An unexpected error was encountered while processing a certificate in the network security services (NSS) server certificate repository. Additional diagnostic messages might be issued.

In the message text:

label

The certificate repository label that identifies the certificate that was being processed when the error was encountered.

error

An internal identifier for this error in the detecting module.

System action

The certificate is ignored by the network security services daemon (NSSD).

Operator response

None.

System programmer response

If the certificate is not intended to be used to create a signature or to be used as a certificate authority certificate, then remove the certificate from the certificate repository.

If the certificate is intended to be used to create a signature or used as a certificate authority certificate, then perform the actions in the problem determination.

User response

None.

Problem determination

If this problem persists, enable the CERTINFO syslog level in the NSSD configuration file and cause the certificate repository to be reprocessed. Check for additional messages relating to this certificate. The certificate repository can be reprocessed by stopping and restarting the NSSD or by modifying the certificate repository.

Source

Example

```
EZD1325I ERROR PROCESSING CERTIFICATE ( LABEL: BADCERT | ERROR: 001F )
```

EZD1326I	REQUEST TYPE <i>request</i> WITH CORRELATOR ID <i>corrid</i> FROM CLIENT <i>clientname</i> FAILED - RETURN CODE <i>returncode</i> REASON CODE <i>reasoncode</i>
-----------------	--

Explanation

A request from a network security services (NSS) client failed.

In the message text:

request

An identifier that describes the type of request.

corrid

A 16-byte identifier used by a client to uniquely identify a request sent to the NSS server.

clientname

The name of the NSS client that originated the request.

returncode

Documents the type of failure. These return codes are listed and described in the networking management information in [z/OS Communications Server: IP Programmer's Guide and Reference](#).

reasoncode

A reason code that documents the reason for the failure. See the information about [network manager return and reason codes](#) in [z/OS Communications Server: IP Programmer's Guide and Reference](#).

System action

The error information is returned to the NSS client. The NSSD continues.

Operator response

Contact the system programmer.

System programmer response

See the information about diagnosing network security services (NSS) server problems in [z/OS Communications Server: IP Diagnosis Guide](#) to determine the appropriate response.

User response

None.

Problem determination

The NSS client might provide additional diagnostic messages containing the same correlator as message EZD1326I. If the administrator of the NSS client can provide diagnostic information, the matching correlator can be used to locate the specific failure condition in the NSS server log file.

```

EZD1327I	NSSD CTRACE INITIALIZATION ERROR - FUNCTION <i>function</i> RETURN CODE <i>rc</i> REASON CODE <i>rsn</i>
-----------------	---

Explanation

The Network Security Services Daemon (NSSD) failed to initialize the CTRACE subsystem.

In the message text:

function

The function that is being processed when the CTRACE error occurred.

rc

The error return code.

rsn

The error reason code.

System action

NSSD continues without CTRACE enabled.

Operator response

See the information about CTRACE macro in [z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN](#) for the return code and reason code explanations for the different CTrace functions. See the information about CTRACE - RESOLVER in [z/OS Communications Server: IP Diagnosis Guide](#) for more information about diagnosing CTRACE problems. Ensure that storage is available for the size of the trace buffers. Ensure that CTRACE definition parameters are set correctly. If these checks do not reveal the cause of the problem, contact the system programmer.

System programmer response

If the problem cannot be resolved, contact IBM software support services and provide a syslog that includes this message.

```
EZD1328I CERTIFICATE REPOSITORY NSSD/KEYRING SUCCESSFULLY PROCESSED FOR NSS INITIALIZATION
```

EZD1329I	ERROR ENCOUNTERED PROCESSING CERTIFICATE REPOSITORY <i>name</i> FOR <i>event</i>
-----------------	---

Explanation

The network security services daemon (NSSD) was unsuccessful in updating its internal representation of the certificate repository.

In the message text:

name

The name of the network security services (NSS) server certificate repository.

event

The event that triggered the certificate repository to be updated. Possible values are:

- NSS initialization
- NSS MODIFY command

- NSS certificate repository update

System action

The NSS server continues to use its previous internal representation of the certificate repository. If a previous internal representation of the certificate repository did not exist, the NSS server will not be able to process certificate requests from network security clients until action is taken to correct the problem.

Operator response

None.

System programmer response

Correct the problem and issue the NSSD MODIFY command.

User response

Not applicable.

Problem determination

If this problem persists, enable the CERTINFO syslog level in the NSSD configuration file and cause the certificate repository to be reprocessed. Check for additional messages relating to this certificate. The certificate repository can be reprocessed by stopping and restarting the NSSD or by modifying the certificate repository.

EZD1329I ERROR ENCOUNTERED PROCESSING CERTIFICATE REPOSITORY NSSD/KEYRING FOR NSS INITIALIZATION
```

EZD1330I	ERROR (<i>gsk_rc</i> <i>description</i>) WHILE OPENING CERTIFICATE REPOSITORY <i>name</i>
-----------------	--

Explanation

The network security services daemon (NSSD) was unable to open the certificate repository specified on the NssConfig statement.

In the message text:

gsk_rc

The hexadecimal CMS status code. See the information about the [CMS status codes \(03353xxx\)](#) in [z/OS Cryptographic Services System SSL Programming](#).

description

Describes the meaning of the *gsk_rc* value.

name

The name of the certificate repository that the NSSD was unable to open.

System action

Processing continues.

Operator response

None.

System programmer response

Ensure that the repository name is defined correctly and that the user under which the NSSD was started is authorized to access the repository. When configured without the IBM Configuration Assistant for z/OS Communications Server, the certificate repository name is set on the KeyRing parameter of the NssConfig statement. See the information about the [copy of the sample in z/OS Communications Server: IP Configuration Reference](#). When configured with the IBM Configuration Assistant for z/OS Communications Server, the certificate repository name is set in the key ring database name located in the Image Information: NSSD Settings panel.

User response

EZD1332I

SYNTAX ERROR IN NSSD CTRACE PARMLIB MEMBER *pname*

Explanation

A syntax error was detected in the specified parmlib member, which is used to configure network security services daemon (NSSD) CTRACE options. NSSD CTRACE is initialized with the minimum tracing option.

In the message text:

pname

The name of the CTRACE parmlib member.

System action

NSSD CTRACE initializes with the minimum tracing option; NSSD continues.

Operator response

Correct the syntax error in the parmlib member. See the information about the Sockets API traces in [z/OS Communications Server: IP Diagnosis Guide](#) for more information about configuring the CTrace parmlib member.

EZD1333I	KEYWORD OR KEYVALUE REJECTED - KEYWORD <i>keyword</i> KEYVALUE <i>keyvalue</i>
-----------------	---

Explanation

The network security services daemon (NSSD) was processing a configuration file and either the keyword is unsupported or the key value is not valid for the keyword.

In the message text:

keyword

The keyword portion of the configuration line.

keyvalue

The value entered for the keyword.

System action

The processing of the configuration file stops. If this error occurs during a MODIFY command, then no changes will be committed and the server continues using the old configuration values. If this error occurs during the initial startup sequence of the server, then the server will not start.

Operator response

Contact the system programmer.

System programmer response

See the information about the [copy of the sample](#) in *z/OS Communications Server: IP Configuration Reference* for information about the NSSD configuration file. Verify that the configuration file contains valid keywords and key values.

{
PORT 4900
}

EZD1335I NssConfigggg IS NOT A RECOGNIZED STATEMENT TYPE
```

EZD1336I

**THE CONFIGURATION VALUE *value* ENTERED FOR *keywordname* IS
OUTSIDE THE ALLOWABLE RANGE *lowvalue* - *highvalue***

Explanation

The value configured for the specified network security services daemon (NSSD) keyword is outside the allowable range.

In the message text:

value

The value configured for the keyword in the NSSD configuration file.

keywordname

The name of the NSSD configuration keyword.

lowvalue

The lowest value allowed for the keyword.

highvalue

The highest value allowed for the keyword.

System action

The processing of the configuration file stops. If this error occurs during a MODIFY command, then no changes are committed and the server continues using the old configuration values. If this error occurs during the initial startup sequence of the server, then the server does not start.

Operator response

Contact the system programmer.

System programmer response

See the information about the [copy of the sample](#) in *z/OS Communications Server: IP Configuration Reference* for information about the NSSD configuration file. Correct the error in the configuration file and restart NSSD or reissue the MODIFY command.

```

EZD1339I	THE LENGTH <i>partlength</i> OF THE <i>parttype</i> PORTION OF THE KEYRING PARAMETER <i>keyringvalue</i> IS OUTSIDE OF THE ACCEPTABLE RANGE OF <i>lowvalue</i> - <i>highvalue</i>
-----------------	--

Explanation

The network security services daemon (NSSD) was processing a configuration file and either the user ID portion or the ring name portion of the Keyring parameter is the wrong length.

In the message text:

partlength

The length of the value as it appeared in the configuration file.

parttype

Possible values are `userid` or `keyring`.

keyringvalue

The value entered for the keyword.

lowvalue

The shortest possible length of the value.

highvalue

The longest possible length of the value.

System action

The processing of the configuration file stops. If this error occurs during a MODIFY command, then no changes are committed and the server continues using the old configuration values. If this error occurs during the initial startup sequence of the server, then the server does not start.

Operator response

See the system programmer.

System programmer response

```
EZD1339I THE LENGTH 12 OF THE USERID PORTION OF THE KEYRING PARAMETER USER00001234/KEYRING IS  
OUTSIDE OF THE ACCEPTABLE RANGE OF 1 - 8  
EZD1339I THE LENGTH 0 OF THE RINGNAME PORTION OF THE KEYRING PARAMETER USER023/ IS  
OUTSIDE OF THE ACCEPTABLE RANGE OF 1 - 237
```

EZD1340I

THE *keyword* VALUE *keyvalue* CONTAINS CHARACTERS THAT ARE NOT 0-9

Explanation

The network security services daemon (NSSD) configuration file contains a value that is not a valid decimal number. The value must contain only the integers in the range 0–9. Negative numbers are not allowed.

In the message text:

keyword

The keyword portion of the configuration line.

keyvalue

The value entered for the keyword.

System action

The processing of the configuration file stops. If this occurs during a MODIFY command, then no changes are committed and the server continues using the old configuration values. If this occurs during the initial startup sequence of the server, then the server does not start.

Operator response

Contact the system programmer.

System programmer response

See the information about the [copy of the sample in z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file. Verify that the configuration file contents are valid.

EZD1340I THE PORT VALUE STARBOARD MAY CONTAIN ONLY THE DECIMAL CHARACTERS 0-9
```

EZD1341I

THE NSS SERVER PORT VALUE *portvalue* IS INCORRECT BECAUSE IT IS OUTSIDE OF THE ALLOWABLE RANGE 1-*maxport*

Explanation

In the network security services daemon (NSSD) configuration file, the port value is not in the range supported by the server.

In the message text:

portvalue

The value specified for the port.

maxport

The maximum value of the port range portvalue is the value that was specified.

System action

The processing of the configuration file stops. If this error occurs during a MODIFY command, then no changes are committed and the server continues using the old configuration values. If this error occurs during the initial startup sequence of the server, then the server does not start.

Operator response

See the system programmer.

System programmer response

No action needed.

OUTSIDE OF THE ALLOWABLE RANGE 1-65535
```

EZD1342I

**THE NSS SERVER CANNOT PROVIDE CERTIFICATE SERVICES USING
THE CURRENTLY CONFIGURED CERTIFICATE REPOSITORY NAME
(*repositoryname*)**

Explanation

The Keyring parameter of the network security services daemon (NSSD) does not specify a usable certificate repository. The Keyring value might appear to be syntactically valid, but it is not correctly configured for use by the user ID under which NSSD is running. Certificate related services cannot be provided.

In the message text:

repositoryname

The name of the certificate repository as configured with the Keyring parameter. This field will be blank if no key ring was specified in the configuration file.

System action

NSSD continues without support for remote certificate related services.

Operator response

Contact the system programmer.

System programmer response

See the information about the [copy of the sample](#) in [z/OS Communications Server: IP Configuration Reference](#) for information. Correct the error in the configuration file and restart NSSD or reissue the MODIFY command.

```

EZD1344I

**AN ERROR OCCURRED WHILE READING THE NSS SERVER
CONFIGURATION FILE *configfile* - RETURN CODE *retcode***

Explanation

A general error occurred while processing the network security services daemon (NSSD) configuration file. Additional messages will be issued to provide more specific information.

In the message text:

configfile

The name of the configuration file that is being processed.

retcode

The general configuration parsing return code. Possible values are:

2

Cannot open the configuration file.

3

There was a syntax or value error in the file.

System action

The processing of the configuration file stops. If this error occurs during a MODIFY command, then no changes are committed and the server continues using the old configuration values. If this error occurs during the initial startup sequence of the server, then the server does not start.

Operator response

Contact the system programmer.

System programmer response

See the information about the [network security services](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file. Verify that the configuration file is present and that the server has permission to read it.

User response

No action needed.

Problem determination

None.

12

Example

```
EZD1344I AN ERROR OCCURRED WHILE READING THE NSS SERVER CONFIGURATION  
FILE, /etc/badpath/nssd.conf - RETURN CODE 2
```

EZD1345I	THIS INSTANCE OF THE NSS SERVER CANNOT START BECAUSE THERE IS ALREADY ANOTHER INSTANCE OF THE SERVER RUNNING ON THIS SYSTEM - TOKEN <i>tokenname</i> LEVEL <i>level</i> PERSIST <i>persist</i> RETURN CODE <i>retcode</i>
-----------------	--

Explanation

Only one network security services daemon (NSSD) can be running at the same time on the same system.

In the message text:

tokenname

The name of the MVS token that the server is trying to get exclusive access to. This value is NSSD for the NSSD.

level

The level of exclusivity required. This value is 4 for NSSD.

persist

Possible values are:

- 0 if the token is released when the server ends
- 1 if it persists after the server ends.

This value is 0 for NSSD.

retcode

The return code from the MVS token service. See the [z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG](#) for a complete list of IEANTCR return and reason codes.

System action

This instance of the network security services (NSS) server does not start.

Operator response

If a copy of the NSSD is already running, then it must be shut down before starting a new instance. If the NSSD is not running, contact the system programmer.

System programmer response

Contact the IBM Service Center with this message.

User response

No action needed.

Problem determination

EZD1347I	INTERNAL ERROR <i>errid</i> IN MODULE <i>modname</i> - UNABLE TO OBTAIN MEMORY OF SIZE <i>size</i>
-----------------	---

Explanation

The network security services daemon (NSSD) was unable to obtain the required amount of memory.

In the message text:

errid

The code that helps IBM service representatives identify the specific storage allocation request.

modname

The name of the module that encountered the error.

size

The amount of storage requested, in bytes.

System action

The current operation fails and the NSSD attempts to continue.

Operator response

Ensure that there is enough memory available on the system and try the operation again. The module name and error ID can be used to determine the exact location of the storage allocation request, if that level of problem determination is required. If so, contact the system programmer with these values.

System programmer response

If you contact IBM software support services in the process of correcting this problem, provide the module name *modname* and error ID *errid* so that the IBM software support services representative can identify the specific storage allocation call that failed.

EZD1354I	NSS SERVER ERROR <i>rc</i> OCCURRED WHILE PROCESSING <i>filename</i> - MODIFY REFRESH COMMAND IS REJECTED
-----------------	--

Explanation

An error occurred during the processing of a configuration file in response to a MODIFY REFRESH command.

In the message text:

rc

The return code. Possible values are:

2

The file does not exist or could not be opened.

3

An error was detected while processing one of the statements in the file.

filename

The name of the configuration file that was being processed.

System action

The processing of the configuration file stops. No changes are committed and the server continues using the old configuration values.

Operator response

Reissue the MODIFY command using the correct file name. If problems persist, contact the system programmer.

System programmer response

See the information about the [copy of the sample](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file. Verify that the configuration file exists, that it is accessible to the server and that the file content is valid.

Example

```
EZD1358I NSS SERVER INITIALIZATION SEQUENCE HAS COMPLETED
```

EZD1359I**NSS SERVER RELEASE *release* SERVICE LEVEL *level* CREATED ON *date***

Explanation

This message is the first message printed to the console when the network security services (NSS) server is started.

In the message text:

release

The release name.

level

The service level name.

date

The server build date.

System action

None.

Operator response

None.

System programmer response

None.

User response

```

EZD1360I

**TCP PORT *portnumber* IS CURRENTLY UNAVAILABLE TO THE NSS
SERVER**

Explanation

The network security services (NSS) server cannot bind to or listen on the specified port because the port is unavailable. The port might be in use by another program, it might be reserved for another program or NSS might not have the authority to access the port.

In the message text:

portnumber

The TCP port to which the NSS server is trying to bind or on which the NSS server is trying to listen.

System action

If this message is issued during server startup, then the server does not start. If this message is issued during a MODIFY REFRESH command, the refresh is rejected and the server continues to run using the configuration values that were in place prior to the refresh attempt.

Operator response

Contact the system programmer.

System programmer response

The network security services (NSS) server must be running on a unique TCP port. In the case of a conflict, either the NSS server or the conflicting program must be reconfigured to use a different TCP port. If NSS does not have access to the port, verify that the port is not reserved for another program and that NSS has been granted sufficient authority to access the port. See the information about the [copy of the sample in z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file.

12

Example

```
EZD1360I TCP PORT 4503 IS CURRENTLY UNAVAILABLE TO THE NSS SERVER
```

EZD1361A**NSS SERVER IS WAITING FOR A TCP/IP STACK TO START****Explanation**

The network security services (NSS) server is waiting for a stack to start.

System action

The NSS server suspends processing until a TCP/IP stack is available.

Operator response

Ensure that a TCP/IP stack is up and running on the NSS server machine. See the information about the [copy of the sample](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information.

System programmer response

No action needed.

User response

Not applicable.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: Network Security Server

Module

NssMainThread.cpp

Routing code

10

Descriptor code

12

Example

```
EZD1361A NSS SERVER IS WAITING FOR A TCP/IP STACK TO START
```

EZD1362A**NSS SERVER IS WAITING FOR TCP PORT *portnumber***

Explanation

The network security services (NSS) server has been configured to listen on the specified TCP port but it cannot bind to or listen on that port because another process is currently using it or because the port is not configured for access.

In the message text:

portnumber

The TCP port number to which the NSS server is trying to bind or on which the NSS server is trying to listen.

System action

The NSS server continues to wait for its port to become available. This message remains on the console until one of the following occurs:

- The port is released and the NSS server is able to bind to and listen on it. Processing continues normally from this point.
- An unrecoverable error occurs while attempting to bind to or listen on the port. The NSS server ends.

- The operator clears the message from the console manually. The NSS server continues to wait for its port. Processing continues when either the port is obtained or the NSS server ends.

Operator response

Contact the system programmer.

System programmer response

Verify that the NSS server is configured to use the correct TCP port. If the NSS server is configured correctly, then determine which other process is using the TCP port or whether there is a configuration error for the TCP port itself. See [z/OS Communications Server: IP Configuration Guide](#) for information about configuring the NSS server and z/OS TCP ports.

```

EZD1363I	EXCEPTION <i>classname</i> ENCOUNTERED IN MODULE <i>modname</i> - ERROR ID <i>internal_error_ID</i> rc rc ERRNO <i>errno</i> ERRNOJR <i>errnojr</i>
-----------------	--

Explanation

A runtime exception was issued.

In the message text:

classname
The name of the exception class.

modname
The name of the module in which the exception was detected.

internal_error_ID
An internal error ID used by IBM to identify the code that detected the error

rc

The return code, if any, from the function call that caused or detected the error condition.

errno

The runtime errno value, if any, at the time the exception was detected.

errnojr

The runtime errno2 value, if any, at the time the exception was detected.

System action

Processing continues in most cases. In some cases the network security services (NSS) server might experience problems or end.

Operator response

Contact the system programmer

System programmer response

This message is not always a sign of an unrecoverable network security services daemon (NSSD) condition. However, any traces or logs containing this message should be forwarded to IBM Service if the server is unable to operate normally after these messages have been logged.

User response

EZD1364I

**NSS SERVER CANNOT WRITE PROCESS ID NUMBER *pid* TO *filename* -
ERRNO *errno* ERRNO DESCRIPTION *description***

Explanation

A file system error occurred when the network security services (NSS) server tried to write its process ID number to a file.

In the message text:

pid

The NSS server process ID.

filename

The file into which the NSS server was trying to write its process ID number.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description

Describes the meaning of the *errno* value.

System action

Network security services daemon (NSSD) processing continues.

Operator response

None.

System programmer response

This is not a problem unless the *pid* file will be used for automation (for example, to automate ending the NSSD). Information about setting the *pid* file location can be found in the [z/OS Communications Server: IP Configuration Guide](#).

User response

Not applicable.

```

EZD1365I

A MESSAGE-GENERATED DUMP HAS BEEN CREATED WITH TITLE *title*

Explanation

A network security services (NSS) server syslog message generated an address space dump. The message that generated the dump appears immediately after this message in the system log.

In the message text:

title

The text associated with the dump. The title contains the message number and associated message text that caused the dump to be generated.

System action

After the dump is created, the network security services daemon (NSSD) continues processing.

Operator response

Contact the system programmer.

System programmer response

Capture the system log and the generated dump. Contact IBM software support services to analyze this data.

User response

Not applicable.

Problem determination

Not applicable.

Source

z/OS Communications Server TCP/IP: Network Security Server

Module

NssLog.cpp

Routing code

10

Descriptor code

12

Example

```
EZD1365I A MESSAGE-GENERATED DUMP HAS BEEN CREATED WITH TITLE NSSD MESSAGE GENERATED
      dump EZD1322I INTERNAL ERROR IN MODULE EZAINMAI 0003 - 0 | 0 | 0
```

EZD1366I

A MESSAGE-GENERATED DUMP WAS SUPPRESSED FOR MESSAGE
message

Explanation

A network security services (NSS) server syslog message attempted to generate an address space dump. However, no more than two message-generated dumps can be created in a 15-minute period, so the dump was

suppressed. The message that attempted to generate the dump appears immediately after this message in the system log.

In the message text:

message

The message that attempted to generate the dump.

System action

Network security services daemon (NSSD) processing continues.

Operator response

Contact the system programmer.

System programmer response

Capture the system log and any message-generated dumps that were created earlier. Contact IBM software support services to analyze this data.

User response

Not applicable.

Problem determination

Not applicable.

Example

```
EZD1366I A MESSAGE-GENERATED DUMP WAS SUPPRESSED FOR MESSAGE  
EZD1322I INTERNAL ERROR IN MODULE EZAINMAI 0003 - 0 | 0 | 0
```

EZD1367I

**NSS *discipline_type* CLIENT *client_name* CONNECTED TO THE NSS
SERVER USING NULL-ENCRYPTION**

Explanation

The network security services (NSS) server and the NSS client negotiated a connection that used the NULL encryption algorithm, but the connection should be encrypted.

In the message text:

discipline_type

The discipline that the NSS client is using.

client_name

The name of the client that is connected to the NSS server.

System action

The NSS server continues to process requests over the unencrypted session.

Operator response

Contact the system programmer.

System programmer response

Modify the AT-TLS policy to require encryption of connections to the NSS server. See the information about the AT-TLS policy statements in [z/OS Communications Server: IP Configuration Reference](#) for more information about AT-TLS policy statements.

User response

No action needed.

Problem determination

None

Source

z/OS Communications Server TCP/IP: Network Security Server

Routing code

10

Descriptor code

12

Automation

This message is written to both the operator console and syslog.

Example

```
EZD1367I NSS XMLAPPLIANCE CLIENT XMLAPPLIANCEDOMAIN1 CONNECTED TO THE NSS  SERVER USING NULL-  
ENCRYPTION
```

EZD1368I

**NSS SERVER CONFIGURATION FILE *parm* PARAMETER DOES NOT
SUPPORT VALUE - *value***

Explanation

An unsupported value was configured for one of the network security services (NSS) parameters.

In the message text:

parm

The parameter that contains the unsupported value.

value

The unsupported value.

System action

Processing of the configuration file stops. If this error occurs during the processing of a MODIFY command, no changes are committed and the server continues using the old configuration values. If this error occurs during the server startup sequence, the server does not start.

Operator response

Contact the system programmer.

System programmer response

Verify that the configuration file contains valid keywords and key values. See the information about the [copy of the sample in z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file.

User response

No action needed.

Problem determination

None

Source

z/OS Communications Server TCP/IP: Network Security Server

Module

NssStatementParser.cpp

Routing code

10

Descriptor code

12

Automation

This message is written to both the operator console and syslog.

Example

```
EZD1368I NSS SERVER CONFIGURATION FILE DISCIPLINE PARAMETER DOES NOT SUPPORT VALUE - IPPEC
```

EZD1369I

**NSS SERVER CONFIGURATION FILE *parm* PARAMETER CONTAINS
EXTRANEIOUS INFORMATION - *text***

Explanation

Extraneous information was configured for one of the network security services (NSS) parameters.

In the message text:

parm

The parameter that contains extraneous information.

text

The extraneous information.

System action

Configuration file processing stops. If this error occurs during a MODIFY command, no changes are committed and the server continues using the old configuration values. If this error occurs during the server startup sequence, the server does not start.

Operator response

Contact the system programmer.

System programmer response

Verify that the configuration file contains valid keywords and key values. See the information about the [copy of the sample in z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file.

User response

No action needed.

Problem determination

None.

Module

NssStatementParser.cpp

Routing code

10

Descriptor code

12

Automation

This message is written to both the operator console and syslog.

Example

If the system programmer configured Discipline IPsec Enable Discipline XMLAppliance Disable in the NSS configuration file, the following message would be issued:

```
EZD1369I NSS SERVER CONFIGURATION FILE DISCIPLINE PARAMETER CONTAINS  EXTRANEOUS INFORMATION -  
DISCIPLINE  
XMLAPPLIANCE DISABLE
```

EZD1370I**INCORRECT SYNTAX ON THE MODIFY NSS SERVER SUBCOMMAND**
subcommand

Explanation

The syntax of the MODIFY network security services (NSS) server command is incorrect. The syntax error occurs after the subcommand.

In the message text:

subcommand

The subcommand portion of the MODIFY command that the operator entered on the console. The syntax error occurs after the subcommand.

System action

The command is ignored.

Operator response

Correct and reissue the command. See the information about the NSS MODIFY command in [z/OS Communications Server: IP System Administrator's Commands](#) for the command syntax.

System programmer response

None.

User response

Not applicable.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: Network Security Server

Module

NssModifyCommandHandler.cpp

Routing code

10

Descriptor code

12

Automation

This message is sent to the console.

Example

If the operator issued the MODIFY NSSD,DISPLAY,ALL command, the following message is issued:

```
EZD1370I INCORRECT SYNTAX ON THE MODIFY NSS SERVER SUBCOMMAND DISPLAY
```

EZD1371I

**AN NSS CLIENT ATTEMPTED TO USE A DISABLED DISCIPLINE
discipline_type TO CONNECT TO THE NSS SERVER - THE CONNECTION
IS CLOSED**

Explanation

A network security services (NSS) client attempted to use a disabled discipline to connect to the NSS server. The connection is closed.

In the message text:

discipline_type

The discipline that is disabled.

System action

The NSS server closes the NSS client TCP connection.

Operator response

Contact the system programmer.

System programmer response

Modify the NSS configuration file to enable the specified discipline. See the information about the [copy of the sample in z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file.

User response

No action needed.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: Network Security Server

Module

Routing code

10

Descriptor code

12

Automation

This message will be written to the syslog.

Example

```
EZD1371I NSS CLIENT ATTEMPTED TO CONNECT USING DISABLED DISCIPLINE IPSEC - THE CONNECTION WILL BE CLOSED.
```

EZD1372I**MODIFY NSS SERVER *subcommand* SUBCOMMAND ACCEPTED**

Explanation

The network security services (NSS) server accepted the MODIFY subcommand.

In the message text:

subcommand

The MODIFY subcommand that was accepted.

System action

The NSS server continues processing the MODIFY command.

Operator response

None.

System programmer response

None.

User response

No action needed.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: Network Security Server

Module

NssModifyCommandHandler.cpp

Routing code

10

Descriptor code

Automation

This message is written to both the operator console and syslog.

Example

```
EZD1372I MODIFY NSS SERVER DISPLAY SUBCOMMAND ACCEPTED
```

EZD1373I	NSS <i>discipline_name</i> DISCIPLINE state
-----------------	--

Explanation

This message is displayed during initialization of the network security services (NSS) server and whenever the state of one of the configured disciplines changes.

In the message text:

discipline_name

The discipline state that is being displayed.

state

The state of the discipline. Possible values are ENABLED or DISABLED.

System action

The NSS server continues processing requests for enabled disciplines. When a discipline is disabled, any connections using that discipline are disconnected. New NSS clients that request a disabled discipline are not allowed to connect.

Operator response

None.

System programmer response

None.

User response

No action needed.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: Network Security Server

Descriptor code

12

Automation

This message is written to both the operator console and syslog.

Example

```
EZD1373I NSS IPSEC DISCIPLINE ENABLED  
EZD1373I NSS XMLAPPLIANCE DISCIPLINE ENABLED
```

EZD1374E**ICSF services are currently unavailable to the NSS daemon**

Explanation

The network security services (NSS) server detected that Integrated Cryptographic Services Facility (ICSF) services are unavailable. The NSS server uses ICSF services for various cryptographic functions. When ICSF services are not correctly configured and started, the NSS server is not fully functional to NSS clients. See the information about [network security services](#) in [z/OS Communications Server: IP Configuration Guide](#) for information about which NSS server functions require ICSF.

System action

The NSS daemon continues to run, but it cannot provide the services that rely on ICSF.

Operator response

Contact the system programmer.

System programmer response

Configure and start ICSF. See the [z/OS Cryptographic Services ICSF Administrator's Guide](#) for more information.

User response

Not applicable.

Problem determination

Not applicable.

z/OS Communications Server TCP/IP: Network Security Server

Module

NssAnchor.cpp

Routing code

3

Descriptor code

3

Automation

This message goes to the console and to syslog.

Example

EZD1374E ICSF services are currently unavailable to the NSS daemon

EZD1375I

**THE *keyword* PARAMETER VALUE *value* EXCEEDS THE MAXIMUM
ALLOWABLE LENGTH OF *maxlength* CHARACTERS**

Explanation

The network security services daemon (NSSD) was processing a configuration file and encountered a configuration value that was too long.

In the message text:

keyword

The configuration parameter on which the erroneous value is specified.

value

The erroneous value.

maxlength

The maximum allowable length for this configuration value.

System action

Processing of the configuration file stops. If this error occurs during a MODIFY command, then no changes are committed and the server continues using the old configuration values. If this error occurs during the initial startup sequence of the server, then the server exits.

Operator response

Contact the system programmer.

System programmer response

See the information about the [copy of the sample information in z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file. Correct the configuration file and then restart NSSD or reissue the MODIFY command.

User response

No action needed.

Problem determination

None.

Example

```
EZD1375I THE CertificateURL PARAMETER VALUE certlabel012345678901234567890123 EXCEEDS THE MAXIMUM  
ALLOWABLE LENGTH OF 32 CHARACTERS
```

EZD1376I

**THE NSS SERVER IGNORED THE CHANGED CONFIGURATION FILE
PARAMETER *pname* - VALUE REMAINS *current_value***

Explanation

The specified network security services (NSS) server configuration file parameter cannot be changed by using the MODIFY *jobname*, REFRESH command. The NSS server continues to use the specified value.

In the message text:

pname

The parameter that cannot be changed on a refresh.

current_value

The value that NSS continues to use.

System action

The NSS server ignores the change to this parameter and configuration processing continues.

Operator response

If you want to use the changed configuration file parameter for the NSS server, contact the system programmer.

System programmer response

If you want to use the changed configuration file parameter for the NSS server, stop and restart the server.

User response

Not applicable.

Problem determination

None.

```

EZD1380I

THE NSS SERVER IS SHUTTING DOWN DUE TO AN ERROR DURING INITIALIZATION (*errno* | *errnojr* | *description*)

Explanation

The network security services (NSS) server encountered an error during initialization. The server is shutting down.

In the message text:

errno

The UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr

The hexadecimal UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

description

Describes the meaning of the *errno* value.

System action

The network security services (NSS) server shuts down.

Operator response

Contact the system programmer.

System programmer response

Correct the error indicated by the *errno*, *errnojr*, or *description* values. This message might be generated during server initialization as the result of a shortage of available disk space in the /var directory.

User response

EZD1380I THE NSS SERVER IS SHUTTING DOWN DUE TO AN ERROR DURING INITIALIZATION ( 133 | 4010237980 |  
EDC5133I NO SPACE LEFT ON DEVICE. )
```

EZD1381I **THE *parmvalue* VALUE IS MISSING FOR CONFIGURATION KEYWORD *keyword***

Explanation

The network security services daemon (NSSD) was processing a configuration file and encountered a configuration parameter that is missing an expected value. This message only appears for configuration parameters that expect multiple values.

In the message text:

parmvalue

The value that is missing.

keyword

The configuration parameter from which the expected value is missing.

System action

The processing of the configuration file stops. If this error occurs during a MODIFY command, then no changes are committed and the server continues to use the old configuration values. If this error occurs during the initial startup sequence of the server, then the server does not start.

Operator response

Contact the system programmer.

System programmer response

Correct the configuration file and then restart NSSD or reissue the MODIFY command. See the information about the [copy of the sample information in z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file.

User response

Example

```
EZD1381I THE URLVALUE IS MISSING FOR CONFIGURATION KEYWORD CertificateBundleURL
```

EZD1382I	THE <i>keyword</i> PARAMETER URL VALUE <i>urlstring</i> IS FORMED INCORRECTLY: <i>explanation</i>
-----------------	--

Explanation

The network security services daemon (NSSD) was processing a configuration file and encountered an incorrectly formed URL value on the specified configuration parameter.

In the message text:

keyword

The configuration parameter that contained the incorrect URL value.

urlstring

The incorrectly formed URL value.

explanation

a description of the specific reason for which the URL is considered to be incorrect.

System action

The processing of the configuration file stops. If this error occurs during a MODIFY command, then no changes are committed and the server continues using the old configuration values. If this error occurs during the initial startup sequence of the server, then the server does not start.

Operator response

Contact the system programmer.

System programmer response

Verify the exact syntax of the URL for HTTP resource and correct the URL in the NSSD configuration file. For information about the rules for forming HTTP URLs, see IETF RFC 3986 and RFC 2616. See [Appendix A, “Related protocol specifications,” on page 1471](#) for information about accessing RFCs. See the information about the [copy of the sample](#) information in [z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file. When corrections have been made, restart NSSD or reissue the MODIFY command.

EZD1384W	URL value on <i>statement_type</i> statement for label <i>label</i> was specified on a previous CertificateURL statement
-----------------	---

Explanation

The network security services (NSS) server, while processing a CertificateURL or CertificateBundleURL statement in the NSS configuration file, recognized that the URL on that statement matches the URL that was specified on a previous CertificateURL statement. Because CertificateURL statements represent a single certificate, the URL on each of the CertificateURL statements must be unique.

In the message text:

statement_type
This value indicates whether the duplicate URL was encountered on a CertificateURL or CertificateBundleURL statement.

label
The label on the CertificateURL or CertificateBundleURL statement that contained the duplicate URL value.

System action

Configuration file processing continues and the NSS server continues.

Operator response

Contact the system programmer.

System programmer response

If the retrieval of one of the certificates or certificate bundles is failing because the wrong URL is specified, locate the duplicate URLs in the NSS configuration file and remove or correct the statement that contains the duplicate URL, then use the MODIFY command to refresh the NSS server configuration. See the information about the [copy of the sample information in z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file

12

Automation

This message is written to syslog only.

Example

```
EZD1384W URL value on CertificateURL statement for label cert3 was specified on a previous
CertificateURL statement
```

EZD1385W	URL value on CertificateURL statement for label <i>label_value</i> was specified on a previous CertificateURL or CertificateBundleURL statement
-----------------	--

Explanation

While it was processing a CertificateURL statement in the NSS configuration file, the network security services (NSS) server recognized that the URL on the CertificateURL statement matched the URL that was specified on a previous CertificateURL or CertificateBundleURL statement. Because CertificateURL statements represent a single certificate, the URL on each of the CertificateURL statements must be unique.

In the message text:

label_value

The value of the label on the CertificateURL or CertificateBundleURL statement that contained the duplicate URL value.

System action

The processing of the configuration file continues and the NSS server continues.

Operator response

Contact the system programmer.

System programmer response

If the retrieval of one of the certificates or certificate bundles is failing because the wrong URL is specified, locate the duplicate URLs in the NSS configuration file and either remove or correct the statement that contains the duplicate URL and then refresh the NSS server configuration using the MODIFY command. See the information about the copy of the sample information in [z/OS Communications Server: IP Configuration Reference](#) for information about the NSSD configuration file.

5,8,9

Automation

This message is written to both the operator console and syslog.

Example

```
EZD1386I DISPLAY NSS CONFIGURATION:
```

EZD1387I	Certificate (<i>label</i>) contains a key that is too short for FIPS 140 mode. Certificate unavailable for the IPSec discipline
-----------------	--

Explanation

The Network Security Services (NSS) server is configured to run in a mode that supports Federal Information Processing Standard 140 (FIPS 140). The NSS server detected that a certificate with the specified label contains an RSA key that is not allowed in FIPS 140 mode. The certificate will not be available for the NSS IPSec certificate service. See the information about [FIPS 140 and IP security](#) in [z/OS Communications Server: IP Configuration Guide](#).

In the message text:

label

The label of the certificate.

System action

NSS server processing continues.

Operator response

None.

System programmer response

If FIPS 140 support is required and the certificate is required for the IPsec discipline, rekey the certificate with an RSA key that has a key size of 1024 bits or greater. If using IKEv2 you can rekey the certificate using an ECDSA key of any length instead of an RSA key. If FIPS 140 support is not required for the NSS server, stop the server, configure FIPS140 No in the NSS server configuration file, and restart the server.

User response

EZD1387I Certificate ( Certificate512 ) contains a key that is too short for  FIPS 140 mode.  
Certificate  
      unavailable for the IPsec discipline
```

EZD1388E**ICSF FIPS mode services are currently unavailable to the NSS daemon**

Explanation

The network security services (NSS) server is configured in Federal Information Processing Standards (FIPS) mode, and the server detected that Integrated Cryptographic Services Facility (ICSF) FIPS mode services are unavailable. The NSS server uses ICSF FIPS mode services for various cryptographic functions. When ICSF FIPS mode services are not correctly enabled, the NSS server will not be fully functional to NSS clients.

See the information about [network security services in z/OS Communications Server: IP Configuration Guide](#) for information about which NSS server functions require ICSF.

See the information about the [copy of the sample information in z/OS Communications Server: IP Configuration Reference](#) for information about the FIPS140 keyword.

System action

The NSS server continues to run, but cannot provide the services that rely on ICSF FIPS mode services.

Operator response

Contact the system programmer.

System programmer response

Configure and start ICSF with FIPS mode enabled. The NSS server automatically detects when ICSF FIPS mode services become available. See the [z/OS Cryptographic Services ICSF Administrator's Guide](#) for more information. Alternatively, change the NSS server configuration to disable FIPS mode, and restart the NSS server.

User response

Example

```
EZD1389I DISPLAY NSS URLCACHE:
```

EZD1390I	ICSF services are currently unavailable to the NSS daemon operating in FIPS 140 mode
-----------------	---

Explanation

The NSS daemon has been configured for FIPS 140 mode and is initializing. ICSF is not currently active. The NSS daemon requires services from ICSF when configured for FIPS 140 mode.

System action

The NSS daemon ends.

Operator response

Contact the system programmer.

System programmer response

The NSS daemon fails to initialize if it is configured for FIPS 140 mode and ICSF is not active.

If you want the NSS daemon to operate in FIPS 140 mode, start ICSF and then restart the NSS daemon.

If you do not want the NSS daemon to operate in FIPS 140 mode, specify "FIPS140 No" in the IPsecDisciplineConfig section of the NSS configuration file and restart the NSS daemon.

EZD1393I	TCP PORT <i>portnumber</i> IS CURRENTLY UNAVAILABLE TO THE NSS SERVER - function FAILED ERRNO <i>errno</i> ERRNOJR <i>errnojr</i>
-----------------	--

Explanation

The network security services (NSS) server cannot bind to or listen on the specified port because the port is unavailable. The port might be in use by another program, it might be reserved for another program or NSS might not have the authority to access the port.

In the message text:

portnumber

The TCP port to which the NSS server is trying to bind or on which the NSS server is trying to listen.

function

The function that failed when establishing the TCP socket for NSS. The possible values are Bind or Listen.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in [Return codes \(errno\)](#) in [z/OS UNIX System Services Messages and Codes](#).

errnojr

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) in [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

This message is issued during NSS server startup. When this error is detected, the NSS server is shutdown.

Operator response

Contact the system programmer.

System programmer response

The network security services (NSS) server must be running on a unique TCP port which is specified in the NSS configuration file. For information on specifying the port in the NSS configuration file see [NssConfig](#) in [z/OS Communications Server: IP Configuration Reference](#).

Verify that the TCP port specified in the NSS configuration file has been reserved for the NSS server in the TCP/IP profile using the PORT or PORTRANGE statement. Use the netstat PORTLIST/-o command to display the list of reserved ports and the port access control configuration for unreserved ports. See [Netstat PORTList/-o report](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for additional information on the netstat PORTLIST/-o command. For information on the PORT and PORTRANGE statements, see [PORT statement](#) and [PORTRANGE](#) in [z/OS Communications Server: IP Configuration Reference](#).

EZD1351I NSS SERVER SHUTDOWN SEQUENCE HAS BEGUN
EZD1356I NSS SERVER SHUTDOWN SEQUENCE HAS COMPLETED
```

EZD1526I

**Connect error for *server* daemon connection : *function* errno *errno*
(*description*) errnojr *errnojr***

Explanation

This message is displayed by the ipsec UNIX command when an error occurred during a connect to the specified daemon.

In the message text:

server

The daemon (DM, IKE, or NSS) to which the ipsec command is trying to connect.

function

The name of the C/C++ run-time library function that detected the error.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description

Describes the meaning of the *errno* value.

errnojr

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The ipsec command processing ends.

Operator response

Not applicable.

System programmer response

Ensure that the specified daemon is running and use the *function*, *errno*, and *errnojr* values to fix the problem.

User response

Contact the system programmer.

Problem determination

Determine whether the daemon is running by issuing the MODIFY *procname*, DISPLAY command where the *procname* value is the member name of the cataloged procedure used to start the daemon.

EZD1528I Receive error on NSSD connection : read errno 1124 (EDC8124I Socket not connected.)  
  errnojr 0x120D025C
```

EZD1529I

Data received over the *server* daemon connection is not valid : return code *returncode*

Explanation

This message is displayed by the ipsec UNIX command when data received from the specified daemon is not in the expected format.

In the message text:

server

The daemon with the connection that received the illegal data. The possible values are DM, IKE, or NSS.

returncode

Possible values are:

1

The message header identifier is not valid.

2

The message header version number is not valid.

3

The message type is not valid.

5

The message header size is not valid.

6

The message size is not valid.

7

The message contains a reserved area that is not set to zeros.

8

The message contains a record length that is not valid.

9

The message contains a record count that is not valid.

10

The message contains a section with a length that is not valid.

11

The message contains a section with a count field that is not valid.

14

The response message contains a correlation ID that does not match the correlation ID in the request message.

15

The response message contains a message type that does not correspond to the message type in the request message.

System action

The ipsec command processing ends.

Operator response

Not applicable.

System programmer response

Run the ipsec command again with the -d option to determine the sequence of events leading up to the error. Contact the IBM Software Support Center.

User response

If the error persists, contact the system programmer.

Problem determination

```

EZD1532I

Client *clientname* is not available

Explanation

The network security services (NSS) client specified with the ipsec -z option cannot be found.

In the message text:

clientname

The name of an NSS client specified with the -z option of the ipsec UNIX command.

System action

The ipsec command processing ends.

Operator response

Not applicable.

System programmer response

Determine whether there is an NssStackConfig statement defining the client in the IKE daemon configuration file on the system where the client is running. See the information about IP security in [z/OS Communications Server: IP Configuration Guide](#) and the information about the IKE daemon in [z/OS Communications Server: IP Configuration Reference](#) for information about configuring the NssStackConfig statement.

User response

Determine whether the NSS client is connected to the NSS server by issuing the ipsec -x display UNIX command on the system where NSS is running. Determine whether the *clientname* value is the name of a valid NSS client by issuing the ipsec -w display UNIX command on the system where the client is running. If the name is not valid, contact the system programmer.

Example

```
EZD1537I 500000 is not a valid srcport value
```

EZD1538I**Option *keyword1 value1* conflicts with option *keyword2 value2*****Explanation**

There is a conflict between the values specified for *keyword1* and *keyword2* on the **ipsec** command.

In the message text:

keyword1

A keyword specified on the **ipsec** command.

value1

The value specified for *keyword1* on the **ipsec** command.

keyword2

A second keyword specified on the **ipsec** command.

value2

The value specified for *keyword2* on the **ipsec** command.

System action

The **ipsec** command processing ends

Operator response

Reissue the **ipsec** command, correcting the conflict identified in the message.

See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

Example

```
EZD1538I Option prot opaque conflicts with option routing either
```

Explanation

The protocol value is not valid with the address type (IPv4 or IPv6) on the **ipsec** command.

In the message text:

protvalue

The protocol value specified on the **ipsec** command.

addresstype

The IP address type of the defensive filter. Possible values are IPv4 or IPv6. The IP address type is determined by the **srcip** and **destip** keywords.

System action

The **ipsec** command processing ends.

Operator response

Reissue the **ipsec** command, correcting the conflict identified by the message.

See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

EZD1539I opaque conflicts with IPv4

Chapter 11. EZD1xxxx messages **1049**

Example

```
EZD1540I Defensive filter Block_inbound_10.1.1.1 successfully added to stack TCPCS
```

EZD1541I

Global defensive filter *filtername* successfully added

Explanation

This message is received in response to an **ipsec -G -F add** command. This message confirms that the global defensive filter was successfully added to all eligible TCP/IP stacks on the z/OS image. An eligible stack is a stack that is enabled for IP security and defined with a mode of active or simulate in the Defense Manager daemon (DMD) configuration file.

In the message text:

filtername

The name of the filter that was added.

See the information about configuring Policy Agent to automatically monitor applications in z/OS Communications Server: IP Configuration Guide for information about global defensive filter add processing.

System action

The z/OS UNIX **ipsec** command processing completes successfully.

EZD1542I All defensive filters successfully deleted from stack *stackname*

Explanation

This message is received in response to an **ipsec -F delete -N all** command that is directed to a specific TCP/IP stack. This message confirms that all defensive filters were deleted from the stack indicated by *stackname*.

In the message text:

stackname

The name of the TCP/IP stack from which the defensive filters were deleted.

See the information about configuring Policy Agent to automatically monitor applications in [z/OS Communications Server: IP Configuration Guide](#) for information about defensive filter delete processing.

System action

The z/OS UNIX **ipsec** command processing completes successfully.

EZD1546I	Defensive filter <i>filtername</i> was not found in stack <i>stackname</i>
----------	--

Explanation

This message is received in response to an **ipsec -F delete** command directed to a specific TCP/IP stack. This message indicates that the defensive filter was not found in the stack.

In the message text:

filtername

The name of the filter specified by the -N option on the **ipsec** command.

stackname

The name of the TCP/IP stack to which the **ipsec** command was directed.

System action

The z/OS UNIX **ipsec** command processing ends.

Operator response

If the filter name specified on the **ipsec** command was incorrect, reissue the **ipsec** command, specifying the correct filter name. Issue the **ipsec -F display** command to display the defensive filters installed in the stack.

See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

EZD1550I Defense Manager daemon reported an error - *error_description*

Explanation

This message is received in response to an **ipsec -F** command. The Defense Manager daemon (DMD) detected an error and reported it to the **ipsec** command processor.

In the message text:

error_description

A description of the error that the DMD reported. Possible values are:

error_description value	Explanation
duplicate filter name	This error description is received in response to an ipsec -F add command that specifies a filter name with the -N option that conflicts with an unexpired defensive filter name.
filter is not found	This error description is received in response to an ipsec -F update command when the filter to be updated is not found.
stack is not configured for IPSECURITY	This error description is received in response to an ipsec -F add command directed to a specific stack when the stack is not configured for IP Security.
stack is not configured for IPv6 IPSECURITY	This error description is received in response to an ipsec -F add command for an IPv6 filter that is directed to a specific stack and the stack is not configured for IPv6 Security.
stack is not configured	This error description is received in response to an ipsec -F add command directed to a specific stack when the stack is not configured with a DmStackConfig statement in the DMD configuration file.
stack mode is INACTIVE	This error description is received in response to an ipsec -F add command directed to a specific stack when the stack is configured as Inactive on the DmStackConfig statement in the DMD configuration file.

<i>error_description</i> value	Explanation
user ID is not authorized	This error description is received in response to an ipsec -F command when the user ID is not authorized to the EZB.IPSECCMD profiles through the security access facility.
too many connections	This error description is received in response to an ipsec -F command when the ipsec command is unable to process the request because it has reached its limit of concurrent ipsec command connections.
log no is not allowed for a filter with mode simulate	This error description is received in response to an ipsec -F update log no command for an existing defensive filter with a mode of simulate. Logging cannot be turned off for a filter with a mode of simulate.
bad data IOCTL failure connection ID is not valid internal error is reported by the Defense Manager daemon memory allocation error cannot retrieve user ID credentials client is already connected	These error descriptions are received in response to an ipsec -F command when an internal error has occurred.

System action

The z/OS UNIX **ipsec** command processing ends.

Operator response

The operator response is based on the *error_description* value as shown in the following table.

<i>error_description</i> value	Operator response
duplicate filter name	Reissue the ipsec -F add command with a unique defensive filter name. See the information about configuring Policy Agent to automatically monitor applications in z/OS Communications Server: IP Configuration Guide for more information.

<i>error_description</i> value	Operator response
filter is not found	<p>If the filter name specified on the ipsec command was incorrect, reissue the ipsec command, specifying the correct filter name. Issue the ipsec -F display command to display the defensive filters installed in the stack.</p> <p>See the information about managing network security in z/OS Communications Server: IP System Administrator's Commands or issue the man ipsec command in a z/OS UNIX shell to obtain information about the ipsec command syntax and options.</p>
stack is not configured for IPSECURITY	Contact the system programmer.
stack is not configured for IPv6 IPSECURITY	Contact the system programmer.
stack is not configured	Contact the system programmer.
stack mode is INACTIVE	Contact the system programmer.
user ID is not authorized	Contact the system programmer.
too many connections	Reissue the ipsec command. If the command continues to fail, contact the system programmer.
log no is not allowed for a filter with mode simulate	None.
bad data IOCTL failure connection ID is not valid internal error is reported by the Defense Manager daemon memory allocation error cannot retrieve user ID credentials client is already connected	Reissue the ipsec command. If the command continues to fail, contact the system programmer.

System programmer response

The system programmer response is based on the *error_description* value as shown in the following table.

<i>error_description</i> value	System programmer response
duplicate filter name	None.
filter is not found	None.
stack is not configured for IPSECURITY	<p>If you want to allow defensive filters to be installed for the TCP/IP stack, enable IP security.</p> <p>See the information about enabling the IP security function in z/OS Communications Server: IP Configuration Guide.</p>

<i>error_description</i> value	System programmer response
stack is not configured for IPv6 IPSECURITY	<p>If you want to allow IPv6 defensive filters to be installed for the TCP/IP stack, enable IP security for IPv6.</p> <p>See the information about enabling the IP security function in <i>z/OS Communications Server: IP Configuration Guide</i>.</p>
stack is not configured	<p>If you want to allow defensive filters to be installed for the TCP/IP stack, configure a DmStackConfig statement for the stack in the DMD configuration file. The Mode keyword must be set to Active or Simulate to enable defensive filtering.</p> <p>See the information about the defensive filtering in <i>z/OS Communications Server: IP Configuration Reference</i> for information about the DMD configuration file.</p>
stack mode is INACTIVE	<p>If you want to allow defensive filters to be installed for the TCP/IP stack, the defensive filtering mode for the stack must be Active or Simulate. If the DmStackConfig statement for this stack in the DMD configuration file has Mode Inactive specified, update the mode to Active or Simulate. Issue the MODIFY REFRESH command to begin using the new value.</p> <p>If the mode is already Active or Simulate, a MODIFY FORCE_INACTIVE command might have been issued, forcing defensive filtering to Inactive. Issue a MODIFY <i>procname</i>,REFRESH,FILE=<i>file</i> command to enable defensive filtering.</p> <p>See the information about the defensive filtering in <i>z/OS Communications Server: IP Configuration Reference</i> for information about the DMD configuration file.</p>
user ID is not authorized	<p>Create the required SERVAUTH profiles to authorize the user ID that is issuing the ipsec command. If the SERVAUTH profiles exist, give the user ID that is issuing the ipsec command permission to access the profiles.</p> <p>See the information about ipsec command security in <i>z/OS Communications Server: IP System Administrator's Commands</i> for more information about the required SERVAUTH profiles.</p>
too many connections	<p>This error might be received as the result of automation that is attempting to add, update, or delete a large number of defensive filters simultaneously. Update the automation to issue the ipsec commands sequentially. If automation is not being used, this error might be the result of an internal error. For an internal error, contact IBM software support services. Provide a dump of the DMD. If available, provide CTRACE information for component SYSTCPDM.</p>

error_description value	System programmer response
log no is not allowed for a filter with mode simulate	None.
bad data IOCTL failure connection ID is not valid internal error is reported by the Defense Manager daemon memory allocation error cannot retrieve user ID credentials client is already connected	Contact IBM software support services. Provide a dump of the DMD. If available, provide CTRACE information for component SYSTCPDM.

```
EZD1550I Defense Manager daemon reported an error - duplicate filter name
```

EZD1551I

option1 is valid only when used with the *option2* primary option

Explanation

An option on the **ipsec** command is valid only with a specific primary option. The **ipsec** command has been issued with a combination of options that is not valid or the primary option is missing.

In the message text:

option1

An option specified on the **ipsec** command.

option2

The primary option on the **ipsec** command for which *option1* is valid.

System action

The z/OS UNIX **ipsec** command processing ends.

Operator response

Reissue the **ipsec** command with a valid combination of options.

See the information about [managing network security in z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man ipsec** command in a z/OS UNIX shell to obtain information about the **ipsec** command syntax and options.

Routing code

10

Descriptor code

12

Automation

This message is written to the system console and syslog on the Policy Agent. You might want to automate on this message to determine when the Policy Agent is ready to provide services for import requestors.

Example

Not applicable.

EZD1577**PAGENT SERVICESCONNECTION STATEMENT CONTAINS ERRORS**

Explanation

A ServicesConnection statement in the main configuration file contains errors on the Policy Agent.

System action

The Policy Agent continues but does not listen for services requestors using the ServicesConnection statement.

Operator response

Contact the system programmer. If the system programmer indicates that more information is required in the Policy Agent log file, restart the Policy Agent with a minimum of LogLevel 127 configured in the main configuration file, or with the -d 1 start option.

System programmer response

Examine the log file to determine the cause of the problem. Correct the Policy Agent configuration errors identified in the log and restart the Policy Agent. If you need more information to diagnose the errors, restart the Policy Agent with a minimum of LogLevel 127 or start the policy server with the -d 1 start option to see the configuration errors.

See the information about the ServicesConnection in [z/OS Communications Server: IP Configuration Reference](#) for information about configuring the ServicesConnection statement.

User response

Not applicable.

Problem determination

Routing code

10

Descriptor code

12

Automation

This message is written to the system console and syslog on the Policy Agent. You might want to automate on this message to determine whether there are configuration errors that will prevent import requestors from connecting to the Policy Agent.

Example

Not applicable.

EZD1578

**PAGENT IS UNABLE TO PROCESS REQUESTS FROM SERVICES
REQUESTORS**

Explanation

The Policy Agent is unable to process requests from services requestors. One possible reason is that the information configured on the ServicesConnection configuration statement is incorrect.

See the information about the [ServicesConnection](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about configuring the ServicesConnection statement.

See the information about [ISAKMP main mode limitations](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for possible reasons this message was issued.

System action

The Policy Agent continues but does not respond to services connection requests.

Operator response

Contact the system programmer. If the system programmer indicates that more information is required in the Policy Agent log file, restart the Policy Agent with a minimum of LogLevel 127 configured in the main configuration file, and with the -d 128 start option.

System programmer response

Examine the log file to determine the cause of the problem. If the problem is the result of a socket or bind failure, the problem might be an incorrect port specified on the ServicesConnection configuration statement. Verify that the port is valid and correct the statement if necessary. Otherwise, restart the Policy Agent with the LogLevel 127 and the -d 128 start option and recreate the problem to diagnose the errors.

See the information about [gathering diagnostic information about Policy Agent problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#) to determine what documentation you should obtain before contacting IBM Service.

User response

Not applicable.

Problem determination

See the system programmer response.

You might also want to automate on the following related message:

```
EZD1576I PAGENT IS READY FOR SERVICES CONNECTION REQUESTS
```

Example

Not applicable.

EZD1579I **PAGENT POLICIES ARE NOT ENABLED FOR *image* : *type***

Explanation

The policies indicated by the *type* value that is defined in a configuration file are not enabled for the TCP/IP stack indicated by the *image* value. The policies are not enabled because the underlying stack function (for example, AT-TLS or IPsec) is not enabled on the stack.

In the message text:

image

The name of the TCP/IP stack.

type

The policy type that is not enabled. Possible values are:

IPSEC

IP Filtering, KeyExchange and LocalDynVpn policies

TTLS

Application Transparent Transport Layer Security (AT-TLS) policies

System action

The results depend on the *type* value as follows:

IPSEC

Policy Agent does not parse or read the IPsec configuration file for this image.

TTLS

Policy Agent reads and parses the AT-TLS configuration file and installs the policies, but the TCP/IP stack does not enforce the policies.

If the ServicesConnection statement is configured with Security Secure, then Policy Agent automatically creates an AT-TLS policy for the connection, but the TCP/IP stack does not enforce the policy and the generated AT-TLS policy is not in effect.

Operator response

See the system programmer response.

System programmer response

The action depends on the *type* value as follows:

IPSEC

If you want IP security to be enabled for IPv4, use the IPCONFIG IPSECURITY statement in the TCP/IP profile to configure the stack for IPv4 IP security. If you want IP security enabled for IPv6, use the IPCONFIG6 IPSECURITY statement in the TCP/IP profile to configure the stack for IPv6 IP security. See the information about [IPCONFIG statement](#) and [IPCONFIG6](#) in [z/OS Communications Server: IP Configuration Reference](#) and the information about [default IP filter policy](#) and [IP security Policy](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

TTLS

If you want AT-TLS enabled, configure the stack for AT-TLS using the TTLS parameter on the TCPCONFIG statement in the TCP/IP profile. See the information about the [TCPCONFIG](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information. See the information about the [AT-TLS configuration](#) in [PROFILE.TCPIP](#) in [z/OS Communications Server: IP Configuration Guide](#) for information about how to enable AT-TLS.

EZD1581I**PAGENT IS UNABLE TO START *application***

Explanation

Policy Agent attempted to start or restart an application that is configured for monitoring on the AutoMonitorApps configuration statement. The application failed to start successfully within the retry limits configured on the AutoMonitorApps configuration statement.

In the message text:

application

The name of the application that failed to start. If the application runs one instance per stack, the corresponding TCP/IP stack name precedes the application name, separated by a forward slash (/).

System action

Policy Agent processing continues.

Operator response

Contact the system programmer.

System programmer response

Look for messages issued by the application to determine the reason why the application failed to start successfully. See the information about running the application in [z/OS Communications Server: IP Configuration Reference](#) to determine whether additional logging or tracing is needed. See the information about the

application in [z/OS Communications Server: IP Diagnosis Guide](#) for additional diagnosis information. When the problem with the application has been resolved, issue a `MODIFY procname,MON,START,applname` command to the Policy Agent to start the application and to resume Policy Agent monitoring of the application. See the information about the [MODIFY command](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for details.

User response

Not applicable.

Problem determination

See the system programmer response.

Example

EZD1581I PAGENT IS UNABLE TO START NSSD

EZD1582I	PAGENT MODIFY COMMAND UNSUCCESSFUL - <i>application</i> ALREADY <i>status</i>
-----------------	--

Explanation

A MODIFY command was issued to the Policy Agent to start or stop one application or all applications that are configured for monitoring on the AutoMonitorApps configuration statement, but the application or applications were already started or stopped.

In the message text:

application

The name of the application that was specified on the MODIFY command. If the application runs one instance per stack, the corresponding TCP/IP stack name precedes the application name, separated by a forward slash (/). If the MODIFY command was issued for all applications, the *application* value is APPLICATIONS.

status

The status of the application.

System action

The MODIFY command is ignored.

```

EZD1583I

**PAGENT MODIFY COMMAND UNSUCCESSFUL - *application* NOT
CONFIGURED FOR MONITORING**

Explanation

A MODIFY command was issued to the Policy Agent to start, restart, or stop an application, but the application is not configured for monitoring on the AutoMonitorApps configuration statement.

In the message text:

application

The name of the application that was specified on the MODIFY command. If the application runs one instance per stack, the corresponding TCP/IP stack name precedes the application name, separated by a forward slash (/).

System action

The MODIFY command is ignored.

Operator response

See the system programmer response.

System programmer response

If you want to monitor the application, configure the application for monitoring. See the information about configuring Policy Agent to automatically monitor applications in [z/OS Communications Server: IP Configuration Guide](#) and the [AutoMonitorApps](#) statement in [z/OS Communications Server: IP Configuration Reference](#) for.

```

EZD1585I**PAGENT *statement* STATEMENT CONTAINS ERRORS**

Explanation

A configuration statement in the main configuration file contains errors.

In the message text:

statement

The name of the configuration statement that contains errors.

System action

Policy Agent processing continues. The specific action that Policy Agent takes depends on the configuration statement, as follows:

AutoMonitorApps

Automatic application monitoring does not occur.

AutoMonitorParms

Automatic application monitoring takes place using default values.

Operator response

Contact the system programmer. If the system programmer indicates that more information is required in the log file, restart the Policy Agent with a minimum of LogLevel 127 configured in the configuration file, or with the -d 1 start option.

System programmer response

Examine the log file to determine the cause of the problem. Correct the Policy Agent configuration errors identified in the log and restart the Policy Agent. If you need more information to diagnose the errors, re-create the error with a minimum of LogLevel 127 or start the Policy Agent with the -d 1 start option to generate the configuration errors. See the information about [Policy configuration files](#) in [z/OS Communications Server: IP Configuration Reference](#) for the syntax of the failing statement.

Automation

This message is written to the system console and syslog. This message is a good candidate for automation. Automation can alert you to when Policy Agent has installed all locally defined policies, so that applications that use those policies can be started.

Example

```
EZD1586I PAGENT HAS INSTALLED ALL LOCAL POLICIES FOR TCPIP1
```

EZD1587I

PAGENT IS UNABLE TO MONITOR APPLICATIONS

Explanation

Policy Agent is unable to monitor applications to determine whether they are active or inactive, or to start, restart, or stop the applications. Possible reasons for this error include configuration errors on the AutoMonitorApps or AutoMonitorParms statement, or an internal error.

System action

Policy Agent processing continues but the automatic application monitoring function is not available.

Operator response

Contact the system programmer. If the system programmer indicates that more information is required in the log file, restart the Policy Agent with a minimum of LogLevel 127 configured in the configuration file, or with the -d 1 start option.

System programmer response

Examine the log file to determine the cause of the problem. If message EZD1585I was issued, correct the Policy Agent configuration errors identified in the log and restart the Policy Agent. If you need more information to diagnose the errors, re-create the error with a minimum of LogLevel 127 or start the Policy Agent with the -d 1 start option. See the information about the AutoMonitorApps statement and the AutoMonitorParms statement in [z/OS Communications Server: IP Configuration Reference](#) for the syntax of the statements. See the information about policy version differences in [z/OS Communications Server: IP Diagnosis Guide](#) for information about gathering documentation for internal errors.

User response

Routing code

10

Descriptor code

12

Automation

This message is written to the system console and syslog. This message is a good candidate for automation. Automation can alert you to when Policy Agent has installed all remotely defined policies, so that applications that use those policies can be started.

Example

```
EZD1589I PAGENT HAS INSTALLED ALL REMOTE POLICIES FOR TCPIP1
```

EZD1590I	PAGENT UPDATE NOTIFICATION FAILED WITH RETURN CODE <i>errno</i> REASON CODE <i>errnojr</i>
-----------------	---

Explanation

This message is received when one of the following types of Policy Agent update notification fails:

- If the Policy Agent is started with the -i/I option, update notification in real time for changes to local files (all configuration files). See [starting Policy Agent from the z/OS shell](#) in [z/OS Communications Server: IP Configuration Reference](#) for details.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

Processing continues without update notification with the following result:

- If the Policy Agent is not notified about updates to local configuration files, new policies are not updated in real time.

Operator response

Contact the system programmer.

System programmer response

Look up the return code and reason code values for the proper action to take. Also examine the Policy Agent log file to determine the name of the files that are having the problem. The following example shows what to look for in the Policy Agent log file:

```
SYSERR :004: plfm_update_event_register: Error Registering file '/etc/pagent/attls.policy', IPC msg  
type = 9,  
token = '0', rc=-1, errno (247) = EDC5247I Operation not supported., errno2=11800631
```

Correct the problem and instruct the operator to restart the Policy Agent if you want update notification.

User response

Not applicable.

Problem determination

See the system programmer response.

12

Automation

This message is written to the system console and syslog for the Policy Agent. You might want to automate on this message to determine when the Policy Agent is not providing update notification and take corrective action.

Example

```
$HASP100 PAGENT ON STCINRDR
IEF695I START PAGENT WITH JOBNAME PAGENT IS ASSIGNED TO USER IBMUSER
, GROUP SYS1
$HASP373 PAGENT STARTED
IEF403I PAGENT - STARTED - TIME=09.54.14
EZZ8431I PAGENT STARTING
EZZ8432I PAGENT INITIALIZATION COMPLETE
EZD1590I PAGENT UPDATE NOTIFICATION FAILED WITH RETURN CODE 247 REASON CODE 11800631
```

EZD1591I

**CONNECTION TO POLICY SERVER FAILED DUE TO DUPLICATE CLIENT
NAME *clientName***

Explanation

The attempt to establish a connection between the Policy Agent that is acting as a policy client and the Policy Agent that is acting as a policy server failed because of duplicate client names on the policy server. For the policy client for each TCP/IP stack, the PolicyServer statement provides the processing and security information for the policy server, including the client's name. If you have configured multiple clients to connect to a policy server you need to verify that each client has a unique name by checking the PolicyServer statement ClientName parameter.

In the message text:

clientName

The duplicate client name of the client that attempted to connect to a policy server.

System action

The policy server continues processing. The policy client uses the configured connection-wait parameter and connection-retry parameter on the ServerConnection statement to automatically retry the primary and backup connections until a connection is established. The policy client can retrieve the configured remote policies only after the connection is established.

Operator response

Save the system log for problem determination and contact the system programmer.

System programmer response

Verify that the client name for each policy client that connects to the policy server is unique. The client name is specified on the ClientName parameter of the PolicyServer statement for each TCP/IP stack for which policy is being retrieved. See ["Steps for configuring the Policy Agent" in z/OS Communications Server: IP Configuration Guide](#) for information on setting up the policy server and client configurations. Correct any configuration errors and restart the Policy Agent on the system where the configuration changes were made.

If needed, examine the log files to determine the duplicate client name that prevented a connection between the policy client and the policy server. If you need more information to diagnose the errors, re-create the error with a minimum of LogLevel 127 and start the policy server or policy client with the -d 128 start option.

User response

No action is needed.

Problem determination

See the System Programmer Response.

12

Automation

This message is written to the system console and syslog for the Policy Agent. You might want to automate on this message to determine when a client connection fails due to a duplicate name.

Example

```
EZD1591I CONNECTION TO POLICY SERVER FAILED DUE TO DUPLICATE CLIENT NAME CLIENT1
```

EZD1601I **INTERNAL ERROR IN MODULE *mod_id* : *err_id* | *value1* | *value2* | *value3***

Explanation

The Defense Manager daemon (DMD) detected an internal error. Additional diagnostic messages might be issued.

In the message text:

mod_id

An internal identifier that indicates the module that detected the error.

err_id

An internal identifier for this error in the detecting module.

value1

Internal error information.

value2

Internal error information.

value3

Internal error information.

System action

Results are unpredictable. One or more address space dumps might be produced with dump titles that match the message text.

Operator response

Contact the system programmer.

System programmer response

Contact IBM software support services and provide the syslog that includes this message. If available, provide CTRACE information for component SYSTCPDM and any dumps associated with this message.

Example

```
EZD1601I INTERNAL ERROR IN MODULE EZADMSSP : 0001 | 0 | 0 | 0
```

EZD1602I

Internal Error *err_id* in module *modname* - unable to obtain memory of size *size*

Explanation

The Defense Manager daemon (DMD) was unable to obtain the required amount of memory.

In the message text:

err_id

The code that helps IBM service representatives identify the specific memory allocation request.

modname

The name of the module that encountered the error.

size

The amount of memory requested, in bytes.

System action

The current operation fails and the DMD attempts to continue processing.

Operator response

Free some memory and try the operation again. If the operation continues to fail, contact the system programmer with the message information.

System programmer response

See the information about diagnosing storage abends and storage growth in [z/OS Communications Server: IP Diagnosis Guide](#) for more information about storage problems. If you cannot resolve the memory allocation shortage, contact IBM software support services and provide the *modname* value and the *err_id* value.

EZD1603I

**THE DEFENSE MANAGER DAEMON FAILED TO WRITE ITS PROCESS ID
pid TO *filename* - ERRNO *errno* ERRNO DESCRIPTION *description***

Explanation

A file system error occurred when the Defense Manager daemon (DMD) tried to write its process ID to a file.

In the message text:

pid

The DMD process ID.

filename

The file into which the DMD was trying to write its process ID.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description

Describes the meaning of the *errno* value.

System action

Defense Manager daemon (DMD) processing continues without a record of the process ID written to the file system.

Operator response

This error is not a problem unless the process ID file will be used for automation (for example, to automate the process of ending the DMD). Contact the System Programmer if the process ID file will be used for automation.

System programmer response

This error is not a problem unless the process ID file will be used for automation (for example, to automate the process of ending the DMD). Use the error information in the message to resolve the problem and restart the DMD. See the information about [configuring the DMD](#) in [z/OS Communications Server: IP Configuration Guide](#) for information about setting the pid file location.

The directory for the process ID file must exist and the DMD user ID must have authority to write to the directory.

Example

```
EZD1605I THE DEFENSE MANAGER DAEMON SHUTDOWN SEQUENCE HAS COMPLETED
```

Explanation

A value that is not valid was detected for the ExcludeAddress keyword in the Defense Manager daemon (DMD) configuration file.

In the message text:

value

The value that is not valid.

linenum

The line number in the DMD configuration file where the value occurs.

reason

The reason the value is not valid.

System action

The processing of the configuration file stops. If this error occurred during the processing of a MODIFY command, then no changes are committed and the daemon continues using the old configuration values. If this error occurred during the initial startup sequence of the daemon, then the daemon ends.

Operator response

Contact the system programmer.

System programmer response

See the information about the [defensive filtering](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about the DMD configuration file. Correct the ExcludeAddress value that is in error.

User response

Not applicable.

Problem determination

None.

Source

Example

```
EZD1606I The ExcludeAddress value 10.1.1.1.1 on line 156 is not valid - ipaddress is not valid
```

EZD1607I	The ExcludeAddress value <i>value</i> on line <i>linenum</i> cannot be accepted because the limit of <i>limit</i> exclusion addresses for a single stack has already been reached
-----------------	--

Explanation

The number of ExcludeAddress keywords that can be specified for a DmStackConfig statement is limited. More ExcludeAddress keywords were specified for a DmStackConfig statement in the Defense Manager daemon (DMD) configuration file than is allowed.

In the message text:

value

The ExcludeAddress value that cannot be accepted.

linenum

The line number in the DMD configuration file where ExcludeAddress keyword occurs.

limit

The number of ExcludeAddress keywords allowed on a DmStackConfig statement.

System action

The processing of the configuration file stops. If this error occurs while a MODIFY command is being processed, then no changes are committed and the daemon continues using the old configuration values. If this error occurs during the initial startup sequence of the daemon, then the daemon ends.

Operator response

Contact the system programmer.

System programmer response

See the information about the [defensive filtering in z/OS Communications Server: IP Configuration Reference](#) for information about the DMD configuration file. Update the DmStackConfig statement so that it does not specify too many ExcludeAddr keywords.

**THE DEFENSE MANAGER DAEMON FAILED TO START BECAUSE THE
DAEMON IS ALREADY RUNNING - TOKEN *tokenname* LEVEL *level*
PERSIST *persist* RETURN CODE *retcode***

Explanation

The Defense Manager daemon (DMD) started and determined that another instance of the DMD is already running. Only one DMD can be running at a time.

In the message text:

tokenname

The name of the MVS token to which the server is trying to get exclusive access. This value is DEFENSE MANAGER for the DMD.

level

The level of exclusivity required. This value is 4 for the DMD.

persist

Possible values are:

0

The token is released when the server stops. This is the value for the DMD.

1

The token persists after the server ends.

retcode

The return code from the MVS token service. See [z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG](#) for a complete list of IEANTCR return and reason codes.

System action

This instance of the DMD ends.

Operator response

If you want to start a new instance of the DMD, stop the active DMD first.

EZD1612I	ERROR (<i>errno</i> <i>errnojr</i> <i>description</i>) WHILE OPENING MESSAGE CATALOG <i>name</i> - DEFAULT MESSAGES WILL BE USED
-----------------	---

Explanation

The Defense Manager daemon (DMD) was unable to open the message catalog. Default messages will be used.

In the message text:

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

description

Describes the meaning of the *errno* value.

name

The message catalog file that the DMD was attempting to open.

System action

DMD processing continues. DMD will use the internal default messages instead of the messages from the external message catalog.

Operator response

If the default messages are acceptable, no action is necessary. Otherwise, contact the system programmer.

System programmer response

Correct the error indicated by the *errno*, *errnojr*, and *description* values. There are several possible causes of this error, such as file or directory permissions that do not allow read access. See [z/OS C/C++ Runtime Library Reference](#) for more information about the `catopen()` function call. A common cause of this error message is an incorrectly set `NLSPATH` environment variable. See the information about the [NLSPATH environment variable](#) in [z/OS UNIX System Services Programming Tools](#).

Example

```
EZD1613I A message-generated dump has been created with title DMD Message generated dump EZD1601I  
INTERNAL ERROR IN MODULE EZADMMTH 0015 - 0 | 0 | 0
```

EZD1614I A message-generated dump was suppressed for message *message*

Explanation

A Defense Manager daemon (DMD) syslog message attempted to generate an address space dump; however, no more than two message-generated dumps can be created in a 15-minute period, so the dump was suppressed.

In the message text:

message

The message that attempted to generate the dump.

System action

DMD processing continues.

Operator response

Contact the system programmer.

System programmer response

Capture the system log and any message-generated dumps that were created earlier. Contact IBM software support services to analyze this data.

User response

Not applicable.

Problem determination

None.

```
EZD1614I A message-generated dump was suppressed for message EZD1601I INTERNAL ERROR IN MODULE  
EZADMMTH 0015 - 0 | 0 | 0
```

EZD1615I

**INCORRECT SYNTAX FOR THE FILE= PORTION OF THE DEFENSE
MANAGER DAEMON MODIFY COMMAND (*specification*)**

Explanation

The file specification on a MODIFY *procname*,REFRESH,FILE=*file* command was incorrect. The file name must be a fully qualified z/OS UNIX file name or an MVS data set name. A z/OS UNIX file name must be enclosed by single quotation marks. MVS data set names must begin with two forward slashes and the data set name must be enclosed by single quotation marks.

In the message text:

specification

The incorrect FILE= *specification*.

System action

The MODIFY command is ignored. Processing continues using the previous configuration values.

Operator response

Correct the file name specification and issue the command again. See the information about the [MODIFY command for DMD](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for information about the syntax of the file name specification.

System programmer response

None.

User response

Source

z/OS Communications Server TCP/IP: Defense Manager daemon

Module

Not applicable.

Routing code

10

Descriptor code

12

Automation

Not applicable.

Example

In the following example, the z/OS UNIX file name was not enclosed by single quotation marks which causes the error.

```
EZD1615I INCORRECT SYNTAX FOR THE FILE= PORTION OF THE DEFENSE MANAGER DAEMON  
MODIFY COMMAND ( ,FILE=/U/USER1/DMD.CONF )
```

In the following example, FILE was misspelled.

```
EZD1615I INCORRECT SYNTAX FOR THE FILE= PORTION OF THE DEFENSE MANAGER DAEMON  
MODIFY COMMAND ( ,FLE='/etc/security/dmd.conf' )
```

EZD1616I

**AN ERROR OCCURRED WHILE READING THE DEFENSE MANAGER
DAEMON CONFIGURATION FILE *filename* - RETURN CODE *rc* - MODIFY
REFRESH COMMAND IS REJECTED**

Explanation

An error occurred during the processing of a Defense Manager daemon (DMD) configuration file in response to a MODIFY REFRESH command.

In the message text:

filename

The name of the configuration file that was being processed.

rc

The return code. The possible return codes are:

2

The file does not exist or could not be opened.

3

An error was detected while processing one of the statements in the file.

System action

Processing of the configuration file stops. No changes are committed and the DMD continues using the old configuration values.

Operator response

If the *rc* value is 2, check that the name of the configuration was specified correctly. Reissue the MODIFY command using the correct file name. If problems persist or if the *rc* value is 3, contact the system programmer.

System programmer response

Verify that the configuration file exists and that the DMD has permission to read it. If the *rc* value is 3, check for a more specific configuration error message in the system log and correct the DMD configuration file error.

See the information about the [defensive filtering](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about the DMD configuration file.

User response

Example

```
EZD1616I AN ERROR OCCURRED WHILE READING THE DEFENSE MANAGER DAEMON CONFIGURATION FILE /u/user1/
dmd.conf
      - RETURN CODE 2 - MODIFY REFRESH COMMAND IS REJECTED
```

EZD1617I

**AN ERROR OCCURRED WHILE READING THE DEFENSE MANAGER
DAEMON CONFIGURATION FILE *filename* - RETURN CODE *rc***

Explanation

An error occurred while processing the Defense Manager daemon (DMD) configuration file during the initial startup sequence. Additional messages will be issued to provide more specific information.

In the message text:

filename

The name of the configuration file that is being processed.

rc

The return code. Possible values are:

2

The file does not exist or could not be opened.

3

An error was detected while processing one of the statements in the file.

System action

DMD initial startup processing fails and the DMD ends.

Operator response

Contact the system programmer.

System programmer response

Verify that the configuration file exists and that the DMD has permission to read it. If the *rc* value is 3, check for a more specific configuration error message in the system log and correct the DMD configuration file error.

See the information about the [defensive filtering](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about the DMD configuration file.

```

EZD1618I

Configuration keyword *keyword* on line *linenum* requires a value

Explanation

The keyword requires a value but a value was not specified in the Defense Manager daemon (DMD) configuration file.

In the message text:

keyword

The name of the keyword that is missing a value.

linenum

The line number in the DMD configuration file of the keyword that requires a value.

System action

The processing of the configuration file stops. If this error occurs while a MODIFY command is being processed, then no changes are committed and the daemon continues using the previous configuration values. If this error occurs during the initial startup sequence of the daemon, then the daemon ends.

Operator response

Contact the system programmer.

System programmer response

Correct the error in the configuration file and restart the DMD or reissue the MODIFY command.

See the information about the [defensive filtering](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about the DMD configuration file.

Example

```
EZD1618I Configuration keyword SyslogLevel on line 74 requires a value
```

EZD1619I

The configuration value *value* for keyword *keyword* on line *linenum* contains one or more characters that are not allowed

Explanation

The Defense Manager daemon (DMD) was processing a configuration file and the keyword value contained one or more characters that are not allowed.

In the message text:

value

The keyword value that contains one or more characters that are not allowed.

keyword

The keyword with the incorrect value.

linenum

The line number in the DMD configuration file where the incorrect keyword value occurs.

System action

The processing of the configuration file stops. If this error occurs while a MODIFY command is being processed, then no changes are committed and the daemon continues using the old configuration values. If this error occurs during the initial startup sequence of the daemon, then the daemon ends.

Operator response

Contact the system programmer.

System programmer response

Correct the error in the configuration file and restart the DMD or reissue the MODIFY command.

See the information about the [defensive filtering](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about the DMD configuration file.

```
EZD1619I The configuration value FF for keyword SyslogLevel on line 75 contains one or more
characters
        that are not allowed
```

EZD1620I **The *keyword* value *value* on line *linenum* is outside of the allowable range *lowvalue* - *highvalue***

Explanation

The value configured for the specified Defense Manager daemon (DMD) keyword is outside the allowable range.

In the message text:

keyword

The name of the DMD configuration keyword.

value

The value configured for the keyword in the configuration file

linenum

The line number where the error occurred in the configuration file.

lowvalue

The lowest value allowed for the keyword.

highvalue

The highest value allowed for the keyword.

System action

The processing of the configuration file stops. If this error occurs while a MODIFY command is being processed, then no changes are committed and the daemon continues using the old configuration values. If this error occurs during the initial startup sequence of the daemon, then the daemon ends.

Operator response

Contact the system programmer.

System programmer response

Correct the error in the configuration file and restart the DMD or reissue the MODIFY command.

Example

```
EZD1620I The SyslogLevel value 256 on line 75 is outside of the allowable range of 0 - 255
```

EZD1621I

**AN ERROR OCCURRED WHILE TRYING TO ACCESS DEFENSIVE FILTER
DIRECTORY *dirname* - ERRNO *errno* *description***

Explanation

An error occurred when the Defense Manager daemon (DMD) tried to access the defensive filter directory.

In the message text:

dirname

The defensive filter directory that the DMD was trying to access.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description

Describes the meaning of the *errno* value.

System action

If this error occurs during the initial startup sequence of the daemon, the daemon ends. Message EZD1611I indicates the completion of the startup sequence. If this error occurs during the operation of the daemon, DMD processing will continue without access to the directory. If the DMD stops and is restarted it will no longer have any access to previously created defensive filters. The DMD must be able to write to the directory so that defensive filters persist when the DMD stops.

Operator response

Contact the system programmer.

System action

None.

Operator response

Example

```
EZD1622I DEFENSE MANAGER DAEMON CONFIGURATION PROCESSING IS COMPLETE USING FILE /etc/security/  
dmd.conf
```

EZD1623I

**DEFENSE MANAGER DAEMON CONFIGURATION FILE NOT SPECIFIED
AND DEFAULT CONFIGURATION FILE *filename* MISSING OR NOT VALID
- USING DEFAULTS FOR CONFIGURATION PARAMETERS**

Explanation

No configuration file was specified, so the Defense Manager daemon (DMD) attempted to use the default configuration file. The default configuration file does not exist or cannot be read so the DMD uses the default configuration values.

In the message text:

filename

The default configuration file name.

System action

DMD processing continues using the default values for configuration parameters.

Operator response

Contact the system programmer.

System programmer response

When there is not a configuration file, defensive filtering is inactive for all TCP/IP stacks on your system. The system-supplied defaults do not include any DmStackConfig statements. If you want values other than the system-supplied defaults, create a configuration file and activate it using the MODIFY REFRESH command.

See the information about the defensive filtering in [z/OS Communications Server: IP Configuration Reference](#) for information about the DMD configuration file.

User response

Not applicable.

Problem determination

/etc/security/dmd.conf MISSING OR NOT VALID - USING DEFAULTS FOR CONFIGURATION PARAMETERS
```

EZD1624I

The Defense Manager daemon socket directory *directory* does not exist and cannot be created - errno *errno description*

Explanation

The Defense Manager daemon (DMD) did not find a preexisting socket directory and was unable to create the directory.

In the message text:

directory

The socket directory that does not exist and that cannot be created by DMD.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description

Describes the meaning of the *errno* value.

System action

DMD initialization stops and the daemon ends.

Operator response

Contact the system programmer.

System programmer response

Ensure that the socket directory exists or that the DMD has the correct permissions to create it. If the DMD needs to create the socket directory, all elements of the directory path must exist, except for the last element. For example, if the socket directory identified in the message is `/var/sock`, then at least the `/var` directory must exist. If the DMD is defined with a nonzero UID, create the `/var/dm` directory before starting the DMD. The directory should be owned by the DMD user ID and the DMD should be able to create, delete, read, and write files to the directory.

User response

Not applicable.

Problem determination

None.

Source

Routing code

10

Descriptor code

12

Automation

Not applicable.

Example

```
EZD1625I THE DEFENSE MANAGER DAEMON COULD NOT INITIALIZE MODIFY AND STOP COMMAND SUPPORT
```

Explanation

The Defense Manager daemon (DMD) was unable to find the specified parmlib member and was initialized with the MINIMUM tracing option.

In the message text:

pname

The name of the CTRACE parmlib member.

System action

DMD CTRACE initializes with the MINIMUM tracing option; the DMD continues processing.

Operator response

If different CTRACE options are required, contact the system programmer.

System programmer response

If different CTRACE options are required, configure the CTRACE parmlib member.

See the information about [TCP/IP services component trace for the DMD in z/OS Communications Server: IP Diagnosis Guide](#) for more information about configuring the CTRACE parmlib member and enabling CTRACE after DMD initialization.

```

EZD1628I

**DEFENSE MANAGER DAEMON CTRACE INITIALIZATION ERROR -
FUNCTION *function* RETURN CODE *rc* REASON CODE *rsn***

Explanation

The Defense Manager daemon (DMD) failed to initialize the CTRACE subsystem.

In the message text:

function

The function that was being processed when the CTRACE error occurred.

rc

The error return code.

rsn

The error reason code.

System action

The DMD continues processing without CTRACE enabled.

Operator response

See the information about CTRACE macro in [z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN](#) for the return code and reason code explanations for the different CTRACE functions.

See the information about TCP/IP services component trace for the DMD in [z/OS Communications Server: IP Diagnosis Guide](#) for more information about configuring the CTRACE parmlib member and enabling CTRACE after DMD initialization.

Ensure that storage is available for the size of the trace buffers. If these checks do not reveal the cause of the problem, contact the system programmer. If you want the DMD to be enabled for CTRACE, stop and restart the DMD when the cause of the problem is identified and resolved.

System programmer response

If the problem cannot be resolved, contact IBM software support services and provide the syslog that includes this message.

EZD1637I**Exception *classname* encountered in module *modname* - error id
internal_error_ID rc rc errno errno errnojr errnojr**

Explanation

A runtime exception was issued.

In the message text:

classname

The name of the exception class.

modname

The name of the module in which the exception was detected.

internal_error_ID

An internal error ID used by IBM to identify the error detected in the module.

rc

The return code, if any, from the function call that caused or detected the error condition.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

errnojr

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

Processing continues in most cases. In some cases, the Defense Manager daemon (DMD) might experience problems or end.

Operator response

Contact the system programmer.

System programmer response

This message does not always indicate an unrecoverable DMD condition. However, any traces or logs that contain this message should be forwarded to IBM software support services if the daemon is unable to operate normally after these messages are logged.

Example

```
EZD1638I The stackname for the DmStackConfig statement on configuration file line 157 is missing or
incorrect - TCP S2
```

EZD1639I **THE DEFENSIVEFILTERDIRECTORY VALUE MAY NOT BE CHANGED BY A REFRESH OPERATION - IN USE *initialdirectory* FAILED *refreshdirectory***

Explanation

The Defense Manager daemon (DMD) configuration file used for the MODIFY REFRESH command contained a different DefensiveFilterDirectory value than the DMD configuration file with which DMD was started. If DefensiveFilterDirectory was not specified in the REFRESH configuration file the default value /var/dm/filters was used. The defensive filter directory cannot be changed with a MODIFY REFRESH command. Stop DMD, then restart DMD with the new defensive filter directory.

In the message text:

initialdirectory

The name of the defensive filter directory with which DMD was started.

refreshdirectory

The name of the defensive filter directory in the REFRESH configuration file that was rejected.

System action

Processing of the configuration file stops. No changes are committed and the daemon continues using the old configuration values.

Operator response

If the DMD should use a different defensive filter directory than the one with which it was started, stop and restart DMD with the configuration file containing the new defensive filter directory name.

```
EZD1639I THE DEFENSIVEFILTERDIRECTORY VALUE MAY NOT BE CHANGED BY A REFRESH OPERATION - IN USE  
/var/dm/filters FAILED /var/dm/filters1
```

EZD1640I

**MISSING OR INCORRECT STACKNAME SPECIFIED FOR
FORCE_INACTIVE MODIFY COMMAND - *stackname***

Explanation

The stack name was specified incorrectly on a MODIFY *procname*,FORCE_INACTIVE,*stackname* command.

In the message text:

stackname

The incorrect stack name. If the stack name is missing, this field is not displayed.

System action

The MODIFY command is ignored.

Operator response

Reissue the MODIFY command with the correct stack name. See the information about the [MODIFY command for DMD in z/OS Communications Server: IP System Administrator's Commands](#) for information about the MODIFY command.

Example

In this example, an incorrect stack name was specified for the MODIFY FORCE_INACTIVE command.

```
MODIFY DMD,FORCE_INACTIVE,TCP CS
```

The following message is the result:

```
EZD1640I MISSING OR INCORRECT SYNTAX FOR STACKNAME PORTION OF FORCE_INACTIVE  MODIFY COMMAND - ,TCP CS
```

In this example, a stack name was not specified for the MODIFY FORCE_INACTIVE command.

```
MODIFY DMD,FORCE_INACTIVE
```

The following message is the result:

```
EZD1640I MISSING OR INVALID SYNTAX FOR STACKNAME PORTION OF FORCE_INACTIVE  MODIFY COMMAND -
```

EZD1641I	STACK <i>stackname</i> IS NOT STARTED AND IS NOT CONFIGURED IN THE DEFENSE MANAGER DAEMON CONFIGURATION FILE
-----------------	---

Explanation

The MODIFY FORCE_INACTIVE command was issued for a TCP/IP stack that is not defined in the Defense Manager daemon (DMD) configuration file. The TCP/IP stack is also down. Defensive filtering is inactive for the specified TCP/IP stack so there is no action for DMD to take to force the defensive filter mode to inactive.

In the message text:

stackname

The name of the TCP/IP stack specified on the MODIFY FORCE_INACTIVE command.

System action

The MODIFY FORCE_INACTIVE command is ignored.

EZD1642I **INCORRECT SYNTAX ON THE MODIFY SUBCOMMAND *subcommand***

Explanation

The syntax of the MODIFY command is incorrect.

In the message text:

subcommand

The subcommand portion of the MODIFY command.

System action

The MODIFY command is ignored.

Operator response

Correct and reissue the MODIFY command. See the information about the [MODIFY command for DMD in z/OS Communications Server: IP System Administrator's Commands](#) for information about the MODIFY command.

```

The following message is the result:

```
EZD1642I INCORRECT SYNTAX ON THE MODIFY SUBCOMMAND DISPLAY
```

EZD1643I

**THE DEFENSIVE FILTER MODE FOR STACK *stackname* WAS
SUCCESSFULLY FORCED TO INACTIVE**

Explanation

A MODIFY FORCE_INACTIVE command was processed successfully, which forced the stack defensive filter mode to inactive.

In the message text:

stackname

The name of the TCP/IP stack specified on the MODIFY FORCE_INACTIVE command.

System action

Defensive filters are deleted from the TCP/IP stack and the defensive filter mode is set to inactive. The Defense Manager daemon (DMD) will not add any defensive filters to the TCP/IP stack while the mode is inactive.

Operator response

None.

EZD1646I

The *keywordname* keyword on configuration file line *linenum* is a duplicate - only one is permitted in each *statementname* statement

Explanation

A duplicate keyword occurs on the specified statement in the Defense Manager daemon (DMD) configuration file.

In the message text:

keywordname

The name of the duplicate keyword.

linenum

The line number in the DMD configuration file where the duplicate keyword occurs.

statementname

The name of the statement in which the duplicate keyword occurs.

System action

The processing of the configuration file stops. If this error occurs while a MODIFY command is being processed, then no changes are committed and the daemon continues using the old configuration values. If this error occurs during the initial startup sequence of the daemon, then the daemon ends.

Operator response

Contact the system programmer.

System programmer response

See the information about the defensive filtering in z/OS Communications Server: IP Configuration Reference for information about the DMD configuration file. Correct the error in the configuration file and restart DMD or reissue the MODIFY command.

EZD1649I

Extra text at end of configuration file line *linenum* is not permitted

Explanation

Extraneous text was found on a line in the Defense Manager daemon (DMD) configuration file.

In the message text:

linenum

The line number in the DMD configuration file where the extraneous text was found.

System action

The processing of the configuration file stops. If this error occurred during the processing of a MODIFY command, then no changes are committed and the daemon continues using the old configuration values. If this error occurred during the initial startup sequence of the daemon, then the daemon ends.

Operator response

Contact the system programmer.

System programmer response

Extraneous text cannot be placed at the end of the line in the DMD configuration file. A comment must be specified on a separate line beginning with a number sign (#). All statements begin with an opening brace ({) and end with a closing brace (}). Each brace must be on a separate line with no other text. See the information about the [defensive filtering in z/OS Communications Server: IP Configuration Reference](#) for information about the DMD configuration file. Remove the extra text at the end of the specified line in the DMD configuration file. Restart DMD or reissue the MODIFY command.

**Unable to open message catalog cat: errno errno (description) errnojr
errnojr - Default messages will be used**

Explanation

An attempt was made to open the **nssctl** command message catalog in the message catalog directory, but the catalog could not be opened for the specified reason. The default location for the message catalog is set by the NLSPATH environment variable.

In the message text:

cat

The name of the catalog the **nssctl** command attempted to open.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description

Describes the meaning of the *errno* value.

errnojr

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Reason codes](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The **nssctl** command processing continues. Default messages will be used.

Operator response

If the default messages are acceptable, no action is necessary. Otherwise, contact the system programmer to correct the indicated error.

Example

The following message is displayed if the NSS daemon or IKE daemon is stopped while a **nssctl** command request is in progress.

```
EZD1666I Receive error on NSS daemon connection : read errno 1124 (EDC8124I Socket not connected.)
          errnojr 0x120D025C
```

EZD1667I

Data received over the *server* daemon connection is not valid : return code *returncode*

Explanation

This message is displayed by the z/OS UNIX **nssctl** command when data received from the daemon is not in the expected format

In the message text:

server

The daemon whose connection received the illegal data.

returncode

Possible values are:

- 1** The message header identifier is not valid.
- 2** The message header version number is not valid.
- 3** The message type is not valid.
- 5** The message header size is not valid.
- 6** The message size is not valid.
- 7** The message contains a reserve area that is not set to zeros.
- 8** The message contains a record length that is not valid.

9

The message contains a record count that is not valid.

10

The message contains a section with a length that is not valid.

11

The message contains a section with a count field that is not valid.

14

The response message contains a correlation ID that does not match the correlation ID in the request message.

15

The response message contains a message type that does not correspond to the message type in the request message.

System action

The **nssctl** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Issue the **nssctl** command again with the -Z option to determine the sequence of events leading up to the error. Contact the IBM Software Support Center.

User response

Example

The following message is displayed if the response message received from the daemon does not correspond to the request message sent to the daemon.

```
EZD1667I Data received over the NSS daemon connection is not valid : return code 14
```

EZD1668I	Message received from <i>server</i> daemon with return code <i>returncode</i> (<i>description</i>) reason code <i>reasoncode</i>
-----------------	---

Explanation

The server daemon returned a response message with a nonzero return code.

In the message text:

server

The NSS daemon from which the **nssctl** command received the message.

returncode

The return code contained in the response message. See the information about network manager return and reason codes in [z/OS Communications Server: IP Programmer's Guide and Reference](#) and the [diagnosing network security services \(NSS\) server problems](#) information in [z/OS Communications Server: IP Diagnosis Guide](#) to determine the appropriate response.

description

Describes the meaning of the *returncode* value.

reasoncode

The reason code contained in the response message. See the information about [network manager return and reason codes](#) in [z/OS Communications Server: IP Programmer's Guide and Reference](#) and the information about [diagnosing network security services \(NSS\) server problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#) to determine the appropriate response. For reason codes that have a mnemonic starting with NSS, look first in the [z/OS Communications Server: IP Programmer's Guide and Reference](#). For reason codes that have a mnemonic starting with the letters NMs, look first in the [z/OS Communications Server: IP Diagnosis Guide](#).

System action

The **nssctl** command processing ends.

Operator response

Contact the system programmer

System programmer response

Correct the problem using the network manager return and reason codes in [z/OS Communications Server: IP Programmer's Guide and Reference](#) or using the information about [diagnosing network security services \(NSS\) server problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#).

Example

```
EZD1669I Internal nssctl command error : return code 1
```

EZD1670I

Client *clientname* is not available

Explanation

The Network Security Services (NSS) client specified with the **nssctl** command -c option cannot be found.

In the message text:

clientname

The name of the NSS client that was specified with the -c option of the z/OS UNIX **nssctl** command.

System action

The **nssctl** command processing ends.

Operator response

Determine whether the NSS client is connected to the NSS server by issuing the z/OS UNIX **nssctl -d** command on the system where the NSS daemon is running.

System programmer response

- For an NSS IPSec client, determine whether there is an NssStackConfig statement that defines the client in the IKE daemon configuration file on the system where the client is running.

See the information about the [IKE daemon](#) in [z/OS Communications Server: IP Configuration Reference](#) and the information about [IP security](#) in [z/OS Communications Server: IP Configuration Guide](#) for information about configuring the NssStackConfig statement.

- For an NSS XMLAppliance client, see the XML appliance documentation for NSS server configuration.

Example

EZD1673I Filter options -c and -D cannot both be specified

EZD1721I	Packet denied by defensive filter: <i>timestamp</i> filter rule= <i>rulename</i> ext= <i>instance</i> sipaddr= <i>sipaddr</i> dipaddr= <i>dipaddr</i> proto= <i>proto</i> tag1 <i>tag1</i> tag2 <i>tag2</i> tag3 <i>tag3</i> Interface= <i>ifcaddr</i> (<i>dir</i>) secclass= <i>secclass</i> dest= <i>dest</i> len= <i>len</i> ifcname= <i>ifcname</i> fragment= <i>frag</i>
-----------------	--

Explanation

An IP packet matched the indicated defensive filter rule and was denied. For this message to be written, the matching defensive filter must have logging enabled.

In the message text:

timestamp
The stack timestamp that indicates the time at which the IP packet was processed by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename
The defensive filter rule name as specified on the -N option when the defensive filter was added with the z/OS UNIX **ipsec** command.

instance
The rule name extension that indicates which instance of the rule name was matched.

sipaddr
The source IP address of the packet.

dipaddr
The destination IP address of the packet.

proto
The protocol from the packet. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)

- OSPF(89)
- IPIP(94)
- MIPv6(135)
- Unknown
- The protocol number

tag1

The *tag1* value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag1* value is **type=** followed by the ICMP or ICMPv6 type, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag1* value is **sport=** followed by the source port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is OSPF, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the OSPF header is not present in the packet as the result of fragmentation.
- If the *proto* value is MIPv6, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the MIPv6 header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag1* value is **=** which indicates that the data is not applicable.

tag2

tag2 value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag2* value is **code=** followed by the ICMP or ICMPv6 code, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag2* value is **dport=** followed by the destination port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag2* value is **=** which indicates that the data is not applicable.

tag3

tag3 value varies depending on the *proto* value and direction.

- If the *proto* value is TCP or UDP, the direction is inbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original source port.
- If the *proto* value is TCP or UDP, the direction is outbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original destination port.
- If the *proto* value is any value not previously mentioned, the *tag3* value is **=** which indicates that the data is not applicable.

ifcaddr

The interface address over which the packet was received or sent.

dir

Possible values are:

I

The packet is inbound.

O

The packet is outbound.

secclass

The security class assigned to the interface. The security class is a numeric value in the range of 1-255.

dest

Possible values are:

local

The destination is a local destination.

routed

The packet is being routed.

len

The packet length.

ifcname

The interface name.

frag

Possible values are:

Y

The packet is a fragment.

N

The packet is not a fragment.

routed

The packet is not a fragment.

Example

```
EZD1721I Packet denied by defensive filter: 07/11/2007 23:40:08.78 filter rule=
Block_192.30.30.0/24
    ext= 1 sipaddr= 192.30.30.1 dipaddr= 192.1.1.1 proto= tcp(6) sport= 65000 dport= 21 -=
    Interface= 192.1.1.1 (I) secclass= 255 dest= local len= 88 ifcname= LINK1 fragment= N
```

EZD1722I

Packet would have been denied by defensive filter: *timestamp* filter
rule= *rulename* ext= *instance* sipaddr= *sipaddr* dipaddr= *dipaddr* proto=
***proto tag1 tag2 tag3* Interface= *ifcaddr (dir)* secclass= *secclass* dest=**
dest* len= *len* ifcname= *ifcname* fragment= *frag

Explanation

An IP packet matched the indicated defensive filter rule and the defensive filter mode is simulate. You can set the defensive filter mode to simulate for a single defensive filter or you can set the mode to simulate for the stack, which overrides the mode on the individual defensive filter rules.

Use the simulate mode to monitor the impact of enabling defensive filters without discarding traffic. When an IP packet matches a defensive filter and the mode is simulate, this message is logged, which indicates that the packet would have been discarded if the mode had been block. The packet is not discarded and IP filtering continues.

In the message text:

timestamp

The stack timestamp that indicates the time at which the IP packet was processed by the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename

The defensive filter rule name as specified on the -N option when the defensive filter was added with the z/OS UNIX **ipsec** command.

instance

The rule name extension that indicates which instance of the rule name was matched.

sipaddr

The source IP address of the packet.

dipaddr

The destination IP address of the packet.

proto

The protocol from the packet. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- MIPv6(135)
- Unknown
- The protocol number

tag1

The *tag1* value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag1* value is **type=** followed by the ICMP or ICMPv6 type, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag1* value is **sport=** followed by the source port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is OSPF, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the OSPF header is not present in the packet as the result of fragmentation.
- If the *proto* value is MIPv6, the *tag1* value is **type=** followed by the type, or followed by the value Unknown if the MIPv6 header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag1* value is **=** which indicates that the data is not applicable.

tag2

tag2 value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag2* value is **code=** followed by the ICMP or ICMPv6 code, or followed by the value Unknown if the ICMP header is not present in the packet as the result of fragmentation.
- If the *proto* value is TCP or UDP, the *tag2* value is **dport=** followed by the destination port, or followed by the value Unknown if the TCP or UDP header is not present in the packet as the result of fragmentation.
- If the *proto* value is any value not previously mentioned, the *tag2* value is **=** which indicates that the data is not applicable.

tag3

tag3 value varies depending on the *proto* value and direction.

- If the *proto* value is TCP or UDP, the direction is inbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original source port.
- If the *proto* value is TCP or UDP, the direction is outbound, and the port has been translated by the CommServer NAT Traversal function, the *tag3* value is **origport=** followed by the original destination port.
- If the *proto* value is any value not previously mentioned, the *tag3* value is **=** which indicates that the data is not applicable.

ifcaddr

The interface address over which the packet was received or sent.

dir

Possible values are:

I

The packet is inbound.

O

The packet is outbound.

secclass

The security class assigned to the interface. The security class is a numeric value in the range of 1-255.

dest

Possible values are:

local

The destination is a local destination.

routed

The packet is being routed.

len

The packet length.

ifcname

The interface name.

frag

Possible values are:

Y

The packet is a fragment.

N

The packet is not a fragment.

routed

The packet is not a fragment.

Routing code

Not applicable for syslog message.

Descriptor code

Not applicable for syslog message.

Automation

Not applicable.

Example

```
EZD1722I Packet would have been denied by defensive filter: 07/11/2007 23:40:08.78 filter rule=
Block_192.30.30.0/24 ext= 1 sipaddr= 192.30.30.1 dipaddr= 192.1.1.1 proto= tcp(6)
sport= 65000 dport= 21 -= Interface= 192.1.1.1 (I) secclass= 255 dest= local len= 88
ifcname= LINK1 fragment= N
```

Defensive filter added: *date time filter rule= rulename ext= instance sipaddr= sipaddr / sip_prefix_length dipaddr= dipaddr / dip_prefix_length proto= proto tag1 tag2 fragmentsonly= fragments_only dir= dir routing= routing mode= mode log= log lifetime= lifetime userid= userid global= global_setting loglimit= loglimit*

Explanation

A defensive filter is added to the TCP/IP stack.

In the message text:

date

The date on which the defensive filter was added to the stack. This date is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

time

The time at which the defensive filter was added to the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rule name

The defensive filter rule name as specified on the -N option when the defensive filter was added with the z/OS UNIX **ipsec** command.

instance

The rule name extension.

sipaddr / sip_prefix_length

The source IP address specification for the defensive filter rule. The value 0.0.0.0/0 indicates that the defensive filter rule applies to all source IPv4 addresses. The value ::/0 indicates that the defensive filter rule applies to all source IPv6 addresses.

dipaddr / dip_prefix_length

The destination IP address specification for the defensive filter rule. The value 0.0.0.0/0 indicates that the defensive filter rule applies to all destination IPv4 addresses. The value ::/0 indicates that the defensive filter rule applies to all destination IPv6 addresses.

proto

The protocol specification for the defensive filter rule. Possible values are:

- ICMP(1)
- IGMP(2)
- IP(4)
- TCP(6)
- UDP(17)
- ESP(50)
- AH(51)
- ICMPv6(58)
- OSPF(89)
- IPIP(94)
- MIPv6(135)
- The protocol number
- ALL

tag1

The *tag1* value varies depending on the *proto* value.

- If the *proto* value is ICMP or ICMPv6, the *tag1* value is **type=** followed by the ICMP or ICMPv6 type, or followed by the value **all**.
- If the *proto* value is TCP or UDP, the *tag1* value is **sport=** followed by the source port range. For example, **sport= 1024-65535**. For a defensive filter that applies to all source ports the *tag1* value is **sport= 1-65535**.
- If the *proto* value is any value not previously mentioned, the *tag1* value is **=** which indicates that the data is not applicable.

tag2

The *tag2* value varies depending on the protocol.

- If the *proto* value is ICMP or ICMPv6, the *tag2* value is **code=** followed by the ICMP or ICMPv6 code, or followed by the value **all**.
- If the *proto* value is TCP or UDP, the *tag2* value is **dport=** followed by the destination port range. For example, **dport= 21-21**. For a defensive filter that applies to all destination ports, the *tag2* value is **dport= 1-65535**.
- If the *proto* value is any value not previously mentioned, the *tag2* value is **=** which indicates that the data is not applicable.

fragments_only

Possible values are:

yes

The defensive filter rule applies only to fragments.

no

The defensive filter rule does not apply only to fragments.

dir

The direction specified for the defensive filter rule. Possible values are inbound and outbound.

routing

The routing specified for the defensive filter rule. Possible values are local, routed, and either.

mode

The defensive filtering mode specified for the defensive filter rule. Possible values are block and simulate.

log

The log specified for the defensive filter rule. Possible values are yes and no. If the *mode* value is Simulate, the *log* value is not applicable and logging is always performed.

lifetime

The lifetime of the defensive filter rule in minutes.

userid

The user ID of the user who added the defensive filter rule.

global_setting

Possible values are:

yes

The defensive filter rule was created as a global filter rule.

no

The defensive filter rule was created as a stack-specific filter rule.

loglimit

The limit on the number of filter-match messages generated for this filter in a 5-minute interval. A value of 0 indicates that there is no limit.

global= no loglimit= 100
```

EZD1724I

**Defensive filter deleted: *timestamp* filter rule= *rulename* ext= *instance*
reason= *reason* userid= *userid***

Explanation

A defensive filter is deleted from the TCP/IP stack.

In the message text:

timestamp

The stack timestamp that indicates the time at which the defensive filter was deleted from the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename

The defensive filter rule name as specified on the -N option when the defensive filter was added with the z/OS UNIX **ipsec** command.

instance

The rule name extension.

reason

The reason that the defensive filter was deleted from the TCP/IP stack. Possible *reason* values are:

expire

The defensive filter lifetime expired and the filter was deleted from the stack.

delete_specific

The defensive filter was deleted because a z/OS UNIX **ipsec** command was issued to delete this filter by name.

delete_all

The defensive filter was deleted because a z/OS UNIX **ipsec** command was issued to delete all the defensive filters on this stack.

defensive_mode_inactive

The defensive filter was deleted because the user changed the defensive filter mode to inactive. The defensive filter mode can be set to inactive by editing the Defense Manager daemon (DMD) configuration file or by issuing the MODIFY *procname*,FORCE_INACTIVE command.

userid

The user ID of the user who deleted the defensive filter. If the *reason* value is *expire* or *defensive_mode_inactive*, the *userid* value is N/A.

```

EZD1725I

Defensive filter updated: *date time filter rule= rulename ext= instance mode= mode log= log lifetime= lifetime userid= userid loglimit= loglimit*

Explanation

One or more values have been updated for a defensive filter in the TCP/IP stack. These updates were made using the z/OS UNIX **ipsec** command.

In the message text:

date

The date on which the defensive filter was updated in the stack. This date is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

time

The time at which the defensive filter was updated in the stack. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

rulename

The defensive filter rule name as specified on the -N option when the defensive filter was added with the z/OS UNIX **ipsec** command.

instance

The rule name extension.

mode

The defensive filtering mode specification for the defensive filter. If the defensive filtering mode was updated with the z/OS UNIX **ipsec** command, the *mode* value is block or simulate. If the defensive filtering mode was not updated, the *mode* value is N/A.

log

The log specification for the defensive filter. If the log setting was updated with the z/OS UNIX **ipsec** command, the *log* value is yes or no. If the log setting was not updated, the *log* value is N/A.

lifetime

The lifetime of the defensive filter in minutes. If the lifetime was updated with the z/OS UNIX **ipsec** command, the *lifetime* value is the new lifetime value. If the lifetime was not updated, the value is N/A.

userid

The user ID of the user who updated the defensive filter.

loglimit

The limit on the number of filter-match messages generated for this filter in a 5-minute interval. A value of 0 indicates that there is no limit. If the log limit was not updated, the value is N/A.

System action

TCP/IP processing continues.

Routing code

Not applicable for syslog message.

Descriptor code

Not applicable for syslog message.

Automation

Not applicable.

Example

```
EZD1725I Defensive filter updated: 07/11/2012 23:40:08.78 filter rule= Block_192.30.30.0/24 ext= 1
mode=
        simulate log= N/A lifetime= N/A userid= USER1 loglimit= 100
```

EZD1726I	SWSA shadow tunnel installation failed <i>timestamp</i> vpnaction= <i>vpnaction</i> tunnelID= <i>tunID</i> AHSPI= <i>AHindex</i> ESPSPI= <i>ESPindex</i> reason= <i>rsn</i> reason code= <i>rsncode</i>
-----------------	--

Explanation

The installation of a Sysplex-Wide Security Associations (SWSA) shadow tunnel for a distributed DVIPA on a target stack failed.

The SWSA function enables a distributing TCP/IP stack to negotiate IPsec tunnels for distributed DVIPAs. The IPsec tunnels are installed on target stacks for the distributed DVIPA as shadow tunnels. SWSA requires that the IP filter policy that applies to the DVIPA be consistent between the target stack and the distributing stack. One reason the tunnel installation might fail is if the IP filter policies are not consistent, therefore the shadow tunnel cannot be installed because the target stack does not have IP filter rules that correspond to that tunnel.

In the message text:

timestamp

Indicates when the installation failure occurred. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This time stamp might be different than the syslogd message time stamp.

vpnaction

The vpnaction name.

- If configured with the IBM Configuration Assistant for z/OS Communications Server, the *vpnaction* name corresponds to the name of the security level in the GUI. The *vpnaction* name also contains a suffix appended to the security level name to guarantee uniqueness.
- If configured in the Policy Agent configuration file, the *vpnaction* name is the name specified on the IpDynVpnAction statement.

tunID

The tunnel ID.

AHindexis

The AH security parameter index.

ESPindexis

The ESP security parameter index.

rsn

Indicates the specific reason the installation failed.

reason	Explanation	Comments
1	Error encountered while you try to install the shadow tunnel.	See the reason codes below for additional information.
2	Error encountered while you try to install the dynamic filter associated with the shadow tunnel.	See the reason codes below for additional information.
3	Target stack is FIPS140 enabled, and the tunnel was not negotiated in FIPS140 compliant mode.	A target stack that is enabled for FIPS140 will not accept a tunnel from a distributing stack that is not enabled for FIPS140.

rsncode

Provides additional information about the installation failure.

reason code	Explanation	Comments
0	No additional information provided.	This value is only applicable when reason has a value of 3.
7	The dynamic filter did not match an anchor filter.	Ensure that the policy on the target stack is consistent with the policy on the distributing stack.
8	Default policy is in use.	The shadow tunnel cannot be installed if the policy from the policy agent is not currently in use.
24	ICSF failure occurred.	This message will be preceded by message EZD1730I that indicates the return and reason Codes from ICSF. See the ICSF and cryptographic coprocessor return and reason codes in z/OS Cryptographic Services ICSF Application Programmer's Guide for the specific actions to be taken.
25	ICSF is not active.	Services from ICSF are required to install this shadow tunnel. ICSF must be started.

reason code	Explanation	Comments
114	Tunnel could not be added to internal structures because of duplicates.	Contact the IBM Software Support Center.
121	The authentication algorithm provided is not supported.	Ensure that the policy on the target stack is consistent with the policy on the distributing stack. Some algorithms are not supported because of export restrictions. Ensure that the algorithm that is being used is supported.
132	Storage shortage	Storage to complete the request is not currently available. Determine the cause of the storage failure.
134	The encryption algorithm provided is not supported.	Ensure that the policy on the target stack is consistent with the policy on the distributing stack. Some encryption algorithms are not supported because of export restrictions. Ensure that the algorithm that is being used is supported.
1008	The dynamic filter being added conflicted with an existing dynamic filter.	Ensure that the policy on the target stack is consistent with the policy on the distributing stack.

See the information about [Sysplex-wide Security Associations](#) in [z/OS Communications Server: IP Configuration Guide](#).

System action

The tunnel installation fails; TCP/IP processing continues.

Operator response

None.

System programmer response

Ensure that the IP filter policy on the distributing stack for all traffic pertaining to the distributed DVIPA is correctly mirrored on the target stack. Also, take any additional action dictated by the reason code.

**ICSF Service CSFPTRC failed: *timestamp* ICSF Return Code=
return_code ICSF Reason Code= *reason_code***

Explanation

The Integrated Cryptographic Service Facility (ICSF) service CSFPTRC returned an error. This service is called to create a session object.

In the message text:

timestamp

The time at which the failure occurred. This time is retrieved from the system time-of-day clock, which usually reflects coordinated universal time (UTC). This timestamp might be different than the syslogd message timestamp.

return_code

The return code value, in hexadecimal format, that was returned by the ICSF service.

reason_code

The reason code value, in hexadecimal format, that was returned by the ICSF service.

System action

The cryptographic request fails and TCP/IP processing continues.

Operator response

None.

EZD1731I

The Defense Manager daemon marked the persistent filter data for stack *stackname* as untrusted

Explanation

When the Defense Manager daemon (DMD) was restarted, an error was detected in the persistent filter data for the stack specified by *stackname*. The persistent filter data file that was named *active.stackname* was renamed to *untrusted.stackname.timestamp*.

In the message text:

stackname

The name of the TCP/IP stack for which the persistent filter data is not trusted.

System action

Defense Manager daemon (DMD) processing continues.

Operator response

Contact the system programmer.

System programmer response

The persistent filter data is maintained for each stack in binary files created by the DMD. The files are created in the directory specified by the `DefensiveFilterDirectory` keyword on the `DmConfig` statement in the DMD configuration file. These binary files are managed by the DMD and must not be modified manually. See the information about the `DefensiveFilterDirectory` parameter in the [DMConfig statement in z/OS Communications Server: IP Configuration Reference](#) for information about the persistent filter data files.

This message can be the result of a change to the `DefensiveFilterDirectory` value, a damaged file system, or manual editing of the persistent filter data file. Restore the valid persistent data, if available, and restart the DMD. For example, if the `DefensiveFilterDirectory` value was changed and the new directory had an outdated persistent data file for the stack, copy the persistent data from the previous directory to the new directory or restore the `DefensiveFilterDirectory` value to its previous value.

If you cannot restore valid persistent data (for example, the file system is damaged), any defensive filters in the stack remain in effect. However, the DMD has no knowledge of the filters. As a result, you cannot update or delete the filters by name. Also, if the stack ends, the DMD cannot reinstall the filters in the stack when the stack is restarted. You can delete all defensive filters from the stack with the **`ipsec -F delete -N all`** command if you do not want the filters to remain in effect until their lifetime expiration. New defensive filters can be successfully added, updated, and deleted.

If you are starting the DMD following the migration and IPL of your system to a new z/OS release, this message might be the result of a change to the internal structure of the persistent filter data. Defensive filters in the persistent data cannot be processed and are not installed. New defensive filters can be successfully added, updated, and deleted. No action is necessary.

If the persistent filter data in the directory specified by `DefensiveFilterDirectory` appears to be valid, contact IBM support services. Provide a dump of the DMD and the file named *untrusted.stackname.timestamp*.

AN ERROR OCCURRED WHILE TRYING TO CREATE THE DMD /var/dm/dmd.sock FILE - ERRNO *errno* description

Explanation

An error occurred when the Defense Manager daemon (DMD) tried to create the /var/dm/dmd.sock file.

In the message text:

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) information in [z/OS UNIX System Services Messages and Codes](#).

description

Describes the meaning of the *errno* value.

System action

DMD initial startup processing fails and the DMD ends.

Operator response

Contact the system programmer.

System programmer response

The DMD user ID must have the authority to create, delete, read, and write the /var/dm/dmd.sock file. The most probable cause of the error is that the DMD user ID does not have the authority to create, delete, read, and write

files in the /var/dm directory. See the information about [configuring the DMD in z/OS Communications Server: IP Configuration Guide](#). After correcting the error, restart the DMD.

This message is written to both the operator console and syslog.

Example

EZD1733I DISPLAY DMD CONFIGURATION:	
EZD1751I	<i>exchange_type</i> exchange retransmit timed out from <i>src_ip</i> port <i>src_port</i> to <i>dest_ip</i> port <i>dest_port</i>

Explanation

The Internet Key Exchange (IKE) daemon exhausted the retransmit limit set for an Internet Key Exchange version 2 (IKEv2) exchange retransmission.

Additional diagnostic messages that have the same message instance number are issued to identify the affected Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

- exchange_type***
The type of the IKEv2 exchange.
- src_ip***
The local security endpoint IP specification.
- src_port***
The source port.
- dest_ip***
The remote security endpoint IP specification.
- dest_port***
The destination port.

System action

The IKEv2 exchange fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Check the connectivity to the remote security endpoint. If connectivity exists, then the remote security endpoint is not responding.

```
EZD1751I IKE_SA_INIT exchange retransmit timed out from 9.1.2.3 port 500 to 9.4.5.6 port 500
```

EZD1752I	No applicable policy for IKEv2 negotiation using <i>policy_object_type</i> <i>policy_object_name</i>
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon is attempting to negotiate an Internet Key Exchange version 2 (IKEv2) Security Association (SA), but the policies defined for that SA are not allowed for IKEv2. This situation can occur when the local policy is written for IKEv1, but the IKE peer uses IKEv2 for SA negotiation. For example, an IpDynVpnAction statement must include at least one IpDataOffer specification. For IKEv2, IpDataOffer specifications that include a HowToEncrypt parameter value other than DoNot and a HowToAuth parameter value of AH are omitted at SA negotiation time because IKEv2 does not support this combination. If all of the IpDataOffer specifications are omitted from the IpDynVpnAction statement due to this restriction, the IKE daemon fails IKEv2 SA negotiation and issues this message.

In the message text:

policy_object_type

The type of the incomplete policy object.

policy_object_name

The name of the incomplete policy object.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

If you did not use the IBM Configuration Assistant for z/OS Communications Server to configure your policy, ensure that the specified policy object has the correct IpDynVpnAction objects for an IKEv2 negotiation. If you did use the IBM Configuration Assistant for z/OS Communications Server to configure your policy, run the Configuration Assistant Health Check to locate policy configuration errors.

EZD1753I

**IKE version *ike_version* exchange *exchange_type* message *message_id*
from *remote_ip* port *remote_port* to *local_ip* port *local_port* is incorrect
because *reason***

Explanation

The specified message is ignored for the given reason.

In the message text:

ike_version

The version of Internet Key Exchange (IKE) from the message header.

exchange_type

The exchange field value in the IKE message header.

message_id

The message ID in the message header.

remote_ip

The remote security endpoint IP specification.

remote_port

The remote port of the IKE daemon peer.

local_ip

The local security endpoint IP specification.

local_port

The local port of the IKE daemon.

reason

The textual description of why the message is incorrect.

Additional diagnostic messages that have the same message instance number are issued to identify the affected Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

System action

The IKE message is ignored; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that it has sent an incorrect message.

User response

Not applicable.

Problem determination

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

simple_net.cpp

Routing code

11

Descriptor code

7

Automation

This message is output to the syslog.

Example

```
EZD1753I IKE version 1.0 exchange 32 message 0 from 1.2.3.4 port 500 to 5.6.7.8 port 500 is  
incorrect  
because the message length indicated in the header of the message is too large
```

EZD1754I Validation failed for COOKIE notify payload received from *remote_ip*
port *remote_port* to *local_ip* port *local_port*

Explanation

When the Internet Key Exchange (IKE) daemon detects a large number of half-open IKE security associations (SAs), it sends a notify payload of type COOKIE to the peer. The peer must duplicate and send back the COOKIE notify payload. The IKE daemon periodically updates the local cookie information and requires that the data in all received COOKIE notify payloads match the local cookie information. If the received cookie data does not match the local cookie information, then it might indicate that the sender is attempting a denial-of-service (DoS) attack against the IKE daemon. This message might be issued with a benign IKE daemon peer if the local cookie information is updated before the peer is able to respond, although such an occurrence is unlikely. A large number of these messages probably indicates a DoS attack.

In the message text:

remote_ip

The remote security endpoint IP specification.

remote_port

The port of the remote IKE daemon peer.

local_ip

The local security endpoint IP specification.

local_port

The port of the local IKE daemon.

System action

IKE daemon processing continues.

Operator response

If more than one EZD1754I message is issued in quick succession, contact the system programmer.

System programmer response

If a large number of EZD1754I messages are issued for the same remote IP address, then the host with that IP address might be mounting a DoS attack against the IKE daemon. Install an IP filter rule to deny IP traffic from that address. If a large number of EZD1754I messages are issued for different remote IP addresses, then it might indicate that an attacker is forging IP addresses. In this case, install IP filter rules to deny IP traffic from all the IP addresses reported as the *remote_ip* value in the EZD1754I messages. See the information about

IP security in [z/OS Communications Server: IP Configuration Guide](#) for information about implementing IP filter rules.

```

EZD1755I	<i>Transform transform_name local_attribute_name attribute value local_attribute_value in local proposal local_proposal_number does not match remote_attribute_name attribute value remote_attribute_value in remote proposal remote_proposal_number</i>
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon was unable to accept a proposal because the local and remote IKEv2 Security Association (SA) transform attribute values were not the same. IKE daemon processing continues to the next proposal. If no proposals are accepted, the SA negotiation fails. This failure is indicated by message EZD0985I, EZD1021I, or EZD1022I being issued later in syslog.

In the message text:

- transform_name***
The name of the transform for which the mismatch occurred.
- local_attribute_name and remote_attribute_name***
The names of the attributes for which the mismatch occurred.
- local_attribute_value and remote_attribute_value***
The attribute values that were not the same.
- local_proposal_number and remote_proposal_number***
The proposal numbers.

System action

IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

If the proposal with the mismatch is the one that should be accepted, notify the administrator of the remote and local security endpoints about the mismatch specification and ask that the configuration be updated with correct values. If the proposal with the mismatch is not the one that should be accepted, you can ignore message EZD1755I. See the information about Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

Routing code

11

Descriptor code

7

Automation

This message is output to syslog.

Example

```
EZD1760I Proposal 3 contains an unsupported transform ID 1 for transform type Encryption Algorithm (ENCR)
```

EZD1761I ***protocol_name protocol proposal proposal_number is incorrectly formatted - reason***

Explanation

The Security Association (SA) proposal is not accepted because it is not formatted correctly. Internet Key Exchange (IKE) daemon processing continues to the next proposal. If no proposals are accepted, the SA negotiation fails. Failure is indicated by message EZD0985I, EZD1021I, or EZD1022I being issued later in syslog.

In the message text:

protocol_name

The name of the protocol.

proposal_number

The proposal number within the payload.

reason

The reason that the proposal is incorrectly formatted.

System action

If the IKE daemon does not accept any of the proposals, the negotiation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Notify the administrator of the remote security endpoint that an incorrectly formatted SA proposal was received.

User response

None.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

Routing code

11

Descriptor code

7

Automation

This message is output to syslog.

Example

```
EZD1761I IKE protocol proposal 1 is incorrectly formatted - proposal too long for payload
```

EZD1762I

**In the response SA payload there is more than one transform type
*transform_type***

Explanation

Internet Key Exchange version 2 (IKEv2) allows at most one transform of each type in a response Security Association (SA) payload.

In the message text:

transform_type

The transform type, described in RFC 5996 *Internet Key Exchange (IKEv2) Protocol*. See [Appendix A, “Related protocol specifications,”](#) on page 1471 for information about accessing RFCs.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Notify the administrator of the remote security endpoint that an incorrectly formatted SA payload was received in a response.

User response

None.

Problem determination

None.

Source

Module

IKEv2SAInitResponse.cpp IKEv2AuthResponse.cpp IKEv2CreateChildResponse.cpp

Routing code

11

Descriptor code

7

Automation

This message is output to the syslog.

Example

```
EZD1762I In the response SA payload there is more than one transform type 2 - Pseudo-random  
Function (PRF)
```

EZD1763I**There is more than one proposal in the response SA payload****Explanation**

Internet Key Exchange version 2 (IKEv2) requires that a Security Association (SA) payload in a response include only one proposal.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Notify the administrator of the remote security endpoint that an SA payload with more than one proposal was received in a response.

User response

None.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

IKEv2SAInitResponse.cpp IKEv2AuthResponse.cpp IKEv2CreateChildResponse.cpp

Routing code

11

Descriptor code

7

Automation

This message is output to the syslog.

Example

```
EZD1763I There is more than one proposal in the response SA payload
```

EZD1764I Multiple proposals with proposal number *proposal_num* were received in the SA payload

Explanation

Internet Key Exchange version 2 (IKEv2) Security Association (SA) payloads can contain multiple proposals. The first proposal in an SA payload must be numbered proposal number 1 and each proposal number must be one greater than the previous. This message indicates that the SA payload contained multiple proposals with the same proposal number.

In the message text:

proposal_num
The proposal number that appears multiple times in the SA payload.

System action

Proposals with the same proposal number are ignored; IKE daemon processing continues

Operator response

None.

System programmer response

Notify the administrator of the remote security endpoint that an incorrectly formatted SA payload was received.

User response

None.

Problem determination

None.

7

Automation

This message is output to the syslog

Example

```
EZD1764I Multiple proposals with proposal number 2 were received in the SA payload
```

EZD1765I	Received an IKEv2 notify payload with status type <i>notify_type</i> in <i>exchange_type message_type</i>
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon received an IKEv2 notify payload that contains the specified status type. Status type notify payloads convey information about the payload sender or the tunnel, and are not an indication of an error.

In the message text:

notify_type

The decimal value of the notify type field, followed by a short text description of the type as defined in RFC 5996 *Internet Key Exchange (IKEv2) Protocol*. See [Appendix A, “Related protocol specifications,”](#) on page

1471 for information about accessing RFCs. If the decimal value that is received is not a known type, the text description is UNKNOWN and the notify payload is ignored.

exchange_type

The type of exchange as described in RFC 5996 *Internet Key Exchange (IKEv2) Protocol*. See [Appendix A, “Related protocol specifications,”](#) on page 1471 for information about accessing RFCs.

message_type

The type of the message. Possible *message_type* values are request or response.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

User response

None.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: IKE daemon

Automation

This message is output to the syslog

Example

```
EZD1765I Received an IKEv2 notify payload with status type 40000 (UNKNOWN) in INFORMATIONAL response
```

EZD1766I

The *payload_type* payload length is *reason*

Explanation

The specified payload length is incorrect.

In the message text:

payload_type

The payload notation as described in RFC 5996 *Internet Key Exchange (IKEv2) Protocol*. See [Appendix A, “Related protocol specifications,” on page 1471](#) for information about accessing RFCs. Possible *payload_type* values are:

AUTH

An authentication payload

CERT

A certification payload

CERTREQ

A certification request payload

CP

A configuration payload

D

A delete payload

E

An encrypted payload

EAP

An extensible authentication payload

IDi

An initiator identification payload

IDr

A responder identification payload

KE

A key exchange payload

Nonce

A nonce payload

N

A notify payload

SA

A Security Association payload

TSi

An initiator traffic selector payload

TSr

A responder traffic selector payload

V

A vendor identifier payload

Unknown

A payload that is unknown to the Internet Key Exchange (IKE) daemon

reason

The reason why the length is not correct.

System action

The payload is ignored; IKE daemon processing continues.

Operator response

None.

System programmer response

Notify the administrator of the remote security endpoint that you received a payload with an incorrect length.

User response

None.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

IKEv2Message.cpp and IKEv2Payload subclasses

Routing code

11

Descriptor code

7

Automation

This message is output to syslog.

Example

```
EZD1766I The TSi payload length is too short for the message
```

EZD1767I

A required `payload_type` payload is missing for a `exchange_type` `message_type`

Explanation

An Internet Key Exchange version 2 (IKEv2) request or response is ignored because it is missing a required payload.

In the message text:

payload_type

The payload notation as described in RFC 5996 *Internet Key Exchange (IKEv2) Protocol*. See [Appendix A, “Related protocol specifications,”](#) on page 1471 for information about accessing RFCs. Possible *payload_type* values are:

AUTH

An authentication payload

CERT

A certification payload

CERTREQ

A certification request payload

CP

A configuration payload

D

A delete payload

E

An encrypted payload

EAP

An extensible authentication payload

IDi

An initiator identification payload

IDr

A responder identification payload

KE

A key exchange payload

Nonce

A nonce payload

N

A notify payload

SA

A Security Association payload

TSi

An initiator traffic selector payload

TSr

A responder traffic selector payload

V

A vendor identifier payload

Unknown

A payload that is unknown to the IKE daemon

exchange_type

The type of message that contains the missing payload.

message_type

The either request or response.

System action

The Internet Key Exchange (IKE) message is ignored; IKE daemon processing continues.

Operator response

None.

System programmer response

Notify the administrator of the remote security endpoint that you received an incorrect message.

User response

None.

Problem determination

None.

This message is output to syslog.

Example

```
EZD1767I A required SA payload is missing for a IKE_AUTH request
```

EZD1768I	<i>Transform transform_name attribute type local_attribute_type length local_attribute_length in local proposal local_proposal_number does not match the length remote_attribute_length of attribute type remote_attribute_type in remote proposal remote_proposal_number</i>
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon was unable to accept a proposal because the local and remote IKEv2 Security Association (SA) transform attribute lengths are not the same. IKE daemon processing continues to the next proposal. If no proposals are accepted, the SA negotiation fails. This failure is indicated by message EZD0985I, EZD1021I, or EZD1022I being issued later in syslog.

In the message text:

transform_name
The name of the transform for which the mismatch occurred.

local_attribute_type and remote_attribute_type
The attribute types.

local_attribute_length and remote_attribute_length
The attribute lengths that are not the same.

local_proposal_number and remote_proposal_number
The proposal numbers.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

If the proposal with the mismatch is the one that should be accepted, notify the administrator of the remote and local security endpoints about the mismatch specification and ask that the configuration be updated with correct values. If the proposal with the mismatch is not the one that should be accepted, you can ignore message EZD1768I. See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

User response

None.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

IKEv2NotifyPayload.cpp

Routing code

11

Descriptor code

7

Automation

This message is output to syslog.

Example

```
EZD1768I Transform ENCR_AES_CBC attribute type 16384 length 4 in local proposal 1 does not match the
length 8 of attribute type 16384 in remote proposal 2
```

EZD1769I

An unsupported transform type *transform_type* was found in proposal *proposal_num*

Explanation

The Security Association (SA) proposal with the specified number is not accepted because it contains a transform with an unsupported type. Internet Key Exchange (IKE) daemon processing continues to the next proposal. If no proposals are accepted, the SA negotiation fails. This failure is indicated by message EZD0985I, EZD1021I, or EZD1022I being issued later in syslog.

In the message text:

transform_type

The transform type that is not supported.

proposal_num

The proposal number in the payload.

System action

If the IKE daemon does not accept any of the proposals, the negotiation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Notify the administrator of the remote security endpoint that an SA payload with an unsupported transform type was received.

User response

None.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

IKEv2SATransform.cpp

Routing code

11

Descriptor code

7

Automation

This message is output to syslog.

Example

```
EZD1769I An unsupported transform type 6 was found in proposal 2
```

EZD1770I	Transform <i>transform_name</i> value for attribute type <i>local_attribute_type</i> in local proposal <i>local_proposal_number</i> does not match value for attribute type <i>remote_attribute_type</i> in remote proposal <i>remote_proposal_number</i>
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon was unable to accept a proposal because the local and remote IKEv2 Security Association (SA) transform attribute values are not the same. IKE daemon processing continues to the next proposal. If no proposals are accepted, the SA negotiation fails. This failure is indicated by message EZD0985I, EZD1021I, or EZD1022I being issued later in syslog.

In the message text:

transform_name

The name of the transform for which the mismatch occurred.

local_attribute_type* and *remote_attribute_type

The attribute types.

local_proposal_number* and *remote_proposal_number

The proposal numbers.

The attribute values are not included in the message because they are variable length and might be as large as 64 kilobytes of data. To obtain the remote proposal value, activate the formatting of IKE messages by using IKE syslog level 8 and attempt the SA negotiation.

System action

IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

If the proposal that contains the mismatch is the one that should be accepted, either alter the local policy to accept the value in this proposal or notify the administrator of the remote security endpoint about the mismatch and ask the administrator to alter the remote configuration to use the correct values. See the information about [Policy Agent](#) and [policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy and the `IkeSyslogLevel` statement.

value for attribute type 16384 in remote proposal 2
```

EZD1771I

**IKE version *version* Security Association *sa_generation* for tunnel
tunnel_id rekeyed**

Explanation

This message indicates that a Security Association (SA) was rekeyed. Internet Key Exchange (IKE), Encapsulated Security Payload (ESP), and Authentication Header (AH) SAs use secret keys that should be used only for a limited amount of time and to protect a limited amount of data. Rekeying is the reestablishment of SAs to take the place of ones that expire.

Additional diagnostic messages with the same message instance number are issued to identify the affected SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

version

The version of the IKE protocol for the SA that was rekeyed.

sa_generation

The number used to differentiate SAs for the same tunnel. The first SA created for a tunnel is number 1.

tunnel_id

The tunnel prefix and number used to identify the tunnel. The tunnel prefix is K for an IKE tunnel and Y for a dynamic tunnel.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

7

Automation

This message is output to the syslog.

Example

```
EZD1772I IKE version 1.0 Security Association 2 for tunnel K11 reauthenticated
```

EZD1773I	Received an IKEv2 notify payload with error type <i>notify_type</i> in <i>exchange_type</i> message_type
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon received an IKEv2 notify payload that contains an error of the specified type. Additional diagnostic messages that have the same message instance number are issued to identify the affected SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

notify_type

The decimal value of the notify type field, followed by a short text description of the type as defined in RFC 5996 *Internet Key Exchange (IKEv2) Protocol*. See [Appendix A, “Related protocol specifications,” on page 1471](#) for information about accessing RFCs. If the decimal value received is not a known error type, the text description is UNKNOWN.

exchange_type

The type of exchange as described in RFC 5996 *Internet Key Exchange (IKEv2) Protocol*. See [Appendix A, “Related protocol specifications,” on page 1471](#) for information about accessing RFCs.

message_type

The type of the message. Possible *message_type* values are request or response.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

Use the *notify_type* value to identify the error. For some error types, you might have to make changes to the security policy, or request that the peer IKE node make changes to its policy, to resolve the issue. See

the information about Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

```

EZD1775I	<i>IKE version <code>version</code> Security Association <code>sa_generation</code> for tunnel <code>tunnel_id</code> created for protecting <code>proto_name</code> traffic between <code>local_ip</code> <code>local_selector_type</code> <code>local_selectors</code> and <code>remote_ip</code> <code>remote_selector_type</code> <code>remote_selectors</code></i>
-----------------	--

Explanation

A new Security Association (SA) has been created with the characteristics given.

In the message text:

- version***
The IKE protocol version used to create the SA.
- sa_generation***
The number used to differentiate SAs for the same tunnel. The first SA created for a given tunnel is number 1.
- tunnel_id***
The tunnel prefix and number used to identify the tunnel. The tunnel prefix is K for an IKE tunnel and Y for a dynamic tunnel.
- proto_name***
The protocol of the traffic protected by the tunnel.

local_ip

The IP address of the local traffic protected by the tunnel.

local_selector_type* and *remote_selector_type

The type of upper-layer selectors protected by the tunnel.

local_selectors

The upper-layer selectors of the local traffic protected by the tunnel.

remote_ip

The IP address of the remote traffic protected by the tunnel.

remote_selectors

The upper-layer selectors of the remote traffic protected by the tunnel.

```

```
EZD1775I IKE version 1.0 Security Association 1 for tunnel Y2 created for protecting ALL(0) traffic
between 10.81.2.1 N/A N/A and 10.81.8.1 N/A N/A
```

EZD1776I

**IKE version *version* Security Association *sa_generation* for tunnel
tunnel_id deleted**

Explanation

This message indicates that a Security Association (SA) was deleted. Multiple SAs are created and deleted to carry tunnel traffic. The deletion of an SA does not imply that the tunnel has ended or is unavailable.

In the message text:

version

The IKE protocol version use to delete the SA.

sa_generation

The number used to differentiate SAs for the same tunnel. The first SA created for a tunnel is number 1.

tunnel_id

The tunnel prefix and number used to identify the tunnel. The tunnel prefix is K for an IKE tunnel and Y for a dynamic tunnel.

System action

IKE daemon processing continues.

7

Automation

This message is output to the syslog.

Example

EZD1776I IKE version 1.0 Security Association 1 for tunnel K1 deleted	
EZD1777I	IKE version <i>version</i> Security Association <i>sa_generation</i> for tunnel <i>tunnel_id</i> has the following attributes - identities : <i>id_protection</i> local authentication : <i>local_auth_method</i> remote authentication : <i>remote_auth_method</i> encryption : <i>encr_function</i> integrity : <i>integ_function</i> PRF : <i>psuedo_random_function</i> DH : <i>dh_group_name</i> lifetime : <i>lifetime</i> lifesize : <i>lifesize</i>

Explanation

This message displays the attributes of a new IKE Security Association (SA).

In the message text:

- version***
The version of the IKE protocol that was used to create the SA.
- sa_generation***
The number used to differentiate SAs for the same tunnel. The first SA created for a tunnel is number 1.
- tunnel_id***
The tunnel prefix and number used to identify the IKE tunnel. The tunnel prefix is K.
- id_protection***
Indicates whether the confidentiality of the local and remote IKE identities is ensured for the IKE tunnel.
- local_auth_method***
The method that the remote peer must use to authenticate the local endpoint.
- remote_auth_method***
The method that IKED must use to authenticate the remote endpoint.
- encr_function***
The name of the encryption function that the IKE tunnel used to provide data confidentiality.
- integ_function***
The name of the integrity function that the IKE tunnel used to provide data integrity.
- psuedo_random_function***
The name of the pseudo-random function that was used to seed the keying material.
- dh_group_name***
The Diffie-Hellman group ID that was used to generate the keying material.
- lifetime***
The length of time that the SA lives in seconds.
- lifesize***
The life size of the SA in kilobytes.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

z/OS Communications Server TCP/IP: IKE daemon

Module

IKEv2IKESA.cpp

Routing code

11

Descriptor code

7

Automation

This message is output to the syslog.

Example

```
EZD1777I IKE version 1.0 Security Association 1 for tunnel K1 has the following attributes -
identities : unprotected local authentication : PresharedKey remote authentication :
PresharedKey encryption : AES-CBC integrity : HMAC-SHA1 PRF : PRF_HMAC_SHA1 DH : Group5
lifetime : 28800 lifesize : NONE
```

EZD1778I *exchange_name message_type message ID msg_id replay detected from remote_ip port remote_port to local_ip port local_port*

Explanation

The Internet Key Exchange (IKE) daemon received a message that is a copy of a message that was received and processed earlier. The previously received and processed messages (replays) are ignored.

In the message text:

- exchange_name**
The name of the exchange for the message.
- message_type**
The message type.
- msg_id**
The message ID number.
- remote_ip**
The remote security endpoint IP specification.
- remote_port**
The remote port of the IKE daemon peer.

local_ip

The local security endpoint IP specification.

local_port

The local port of the IKE daemon.

System action

The IKE message is not processed; IKE daemon processing continues.

Operator response

None.

System programmer response

Replays are not errors. Replays might be caused by lost packets or network congestion. Usually, no action is required. If there are a large number of replays, notify the administrator of the remote security endpoint that you are receiving a large number of replays.

User response

Not applicable.

Problem determination

None.

Source

Module

IKEv2ExchangeList.cpp

Routing code

11

Descriptor code

7

Automation

This message is output to syslog.

Example

```
EZD1778I IKE_SA_INIT request message ID 0 replay detected from 1.2.3.4 port 500 to 5.6.7.8 port 500
```

EZD1779I

IKE version *version* Security Association *sa_generation* for tunnel *tunnel_id* has the following attributes - encapsulation : *encap_mode* encryption : *encr_function* integrity : *integ_function* lifetime : *lifetime* lifesize : *lifesize* VpnLife : *vpn_life* PFS : *dh_group_name*

Explanation

A new Security Association (SA) has been created with the specified characteristics.

In the message text:

version

The IKE protocol version used to create the SA.

sa_generation

The number used to differentiate SAs for the same tunnel. The first SA created for a given tunnel is number 1.

tunnel_id

The tunnel prefix and number used to identify the dynamic tunnel. The tunnel prefix is Y.

encap_mode

The tunnel encapsulation mode, which is either TUNNEL or TRANSPORT.

encr_function

The name of the encryption function used by the dynamic tunnel to provide data confidentiality.

integ_function

The name of the integrity function used by the dynamic tunnel to provide data integrity.

lifetime

The length of time that the SA lives in seconds.

lifesize

The SA lifesize, in kilobytes.

vpn_life

Specifies how long IPsec SAs should continue to be rekeyed, in seconds. The *vpn_life* value is set for a dynamic tunnel when the first SA is established for the tunnel.

dh_group_name

The Diffie-Hellman (DH) group ID used for perfect forward secrecy. For IKE version 2.0, the first IPsec SA created under each IKE SA uses the DH group that is configured for the IKE SA, regardless of what was configured in the policy for that IPsec SA. In all other cases, the DH group used is the one that is configured in the policy for the IPsec SA.

System action

IKE daemon processing continues.

7

Automation

This message is output to the syslog.

Example

```
EZD1779I IKE version 1.0 Security Association 1 for tunnel Y2 has the following attributes -  
encapsulation : TRANSPORT encryption : DES_CBC_8 integrity : HMAC_SHA1 lifetime : 14400  
lifesize : NONE VpnLife : NONE PFS : GROUP1
```

EZD1780I **The *message_type* for *exchange_type* exchange with message ID *message_id* from *remote_ip* port *remote_port* to *local_ip* port *local_port* is outside the expected window of *lowest_expected* to *highest_expected***

Explanation

The message in the exchange with the specified ID is ignored because the ID is not in the expected message ID window.

In the message text:

message_type

The type of message. Possible *message_type* values are request or response.

exchange_type

The type of exchange as described in RFC 5996 *Internet Key Exchange (IKEv2) Protocol*. See [Appendix A](#), “Related protocol specifications,” on page 1471 for information about accessing RFCs.

message_id

The ID of the message.

remote_ip

The remote security endpoint IP specification.

remote_port

The remote port of the Internet Key Exchange (IKE) daemon peer.

local_ip

The local security endpoint IP specification.

local_port

The local port of the IKE daemon.

lowest_expected

The lowest message ID number that is expected from the remote security endpoint.

highest_expected

The highest message ID number that is expected from the remote security endpoint.

System action

The IKE message is not processed; IKE daemon processing continues.

Operator response

None.

System programmer response

Notify the administrator of the remote security endpoint that a protocol error occurred.

User response

Not applicable.

Problem determination

None.

Routing code

11

Descriptor code

7

Automation

This message is output to the syslog.

Example

```
EZD1780I The request for IKE_AUTH exchange with message ID 2 from 1.2.3.4 port 500 to 5.6.7.8
port 500 is outside the expected window of 1 to 1
```

EZD1781I	Received a delete payload with an unrecognized SPI value for protocol <i>protocol</i>
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon received a delete payload command from an IKE peer that contains an unrecognized security parameter index (SPI) value that represents an IPsec tunnel that is to be deleted. This situation might occur if IKED was restarted, if a sysplex-wide Security Association (SWSA) takeover occurred recently, or if packets are being dropped in the network.

In the message text:

value

The hexadecimal SPI value that was received.

protocol

The name of the protocol. Possible *protocol* values are AH or ESP.

System action

The SPI that is to be deleted is ignored; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Compare local IKE syslog output with any log information available at the remote IKE security endpoint to determine whether the SPI value should have been known to IKE.

User response

Not applicable.

Problem determination

Not applicable.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

Routing code

11

Descriptor code

7

Automation

This message is output to the syslog.

Example

```
EZD1781I Received a delete payload with an unrecognized SPI 44BA7983 for protocol ESP
```

EZD1782I	Received a delete payload with SPI <i>spi_value</i> for protocol <i>protocol</i> that does not belong to this IKE_SA
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon received a message from an IKEv2 peer that contained a security parameter index value that represents a child Security Association (SA) that is to be deleted. However, the message was protected by an IKE SA other than the IKE SA to which the child SA belongs. The IKEv2 peer is in error; RFC 5996 *Internet Key Exchange (IKEv2) Protocol* section 1.4 requires that notification messages for child SAs are to be protected only by the IKE SA that generated the child SA. See [Appendix A, “Related protocol specifications,” on page 1471](#) for information about accessing RFCs.

In the message text:

spi_value

The hexadecimal SPI value that was received.

protocol

The protocol value. Possible *protocol* values are AH or ESP.

System action

The tunnel to be deleted is ignored; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Examine the logging information that is available at the remote IKE security endpoint to determine whether the child SA was incorrectly deleted.

User response

Not applicable.

Problem determination

Not applicable.

Example

```
EZD1782I Received a delete payload with SPI 44BA7983 for protocol ESP that does not belong to this
IKE_SA
```

EZD1783I	Received a notify payload with an unrecognized SPI value for protocol <i>protocol</i>
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon received a notify payload command from an IKE peer that contains an unrecognized security parameter index (SPI) value that represents an IPsec tunnel. This situation might occur if

IKED was restarted, if a sysplex wide Security Association (SWSA) takeover occurred recently, or if packets are being dropped in the network.

In the message text:

value

The hexadecimal SPI value that was received.

protocol

The name of the protocol. Possible *protocol* values are AH or ESP.

System action

The notify payload is ignored; IKE daemon processing continues.

Operator response

Contact the systems programmer.

System programmer response

Compare IKE syslog output with any log information available at the remote IKE security endpoint to determine whether the SPI value should have been known to IKE.

User response

Not applicable.

Problem determination

None.

Automation

This message is output to the syslog.

Example

```
EZD1783I Received a notify payload with an unrecognized SPI 44BA7983 for protocol ESP
```

EZD1784I

**Received optional IDr payload but could not find applicable
KeyExchangeRule - LocalIp : *LSIP* RemoteIp : *RSIP* LocalID : *LSID*
RemoteID : *RSID***

Explanation

The remote IKEv2 peer provided an optional Identification - Responder (IDr) payload in its IKE_SA_INIT request to the local Internet Key Exchange (IKE) daemon. This IDr payload contained an identity that did not match the local key exchange policy, so the local identity (LocalID) that is specified by the optional IDr payload is ignored.

Additional messages that have the same message instance number are issued to identify the affected SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

LSIP

The local security endpoint IP address.

RSIP

The remote security endpoint IP address.

LSID

The local security endpoint identity as provided by the remote IKEv2 peer. The LSID is an ID type followed by optional data.

RSID

The remote security endpoint identity as provided by the remote IKEv2 peer. The RSID is an ID type followed by optional data.

The ID type is one of the values defined in RFC 5996 *Internet Key Exchange (IKEv2) Protocol* section 1.4. For example, ID_IPV4_ADDR, ID_FQDN, or ID_IPV6_ADDR

See [Appendix A, “Related protocol specifications,” on page 1471](#) for information about accessing RFCs.

System action

IKE daemon processing continues; the local identity (LocalID) that is specified by the optional IDr payload is ignored.

Operator response

Add a suitable KeyExchangeRule statement for the classification to the IPsec policy, if necessary. See the information about [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

System programmer response

None.

User response

Not applicable.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

polycmgr.cpp

Routing code

11

Descriptor code

7

Automation

This message is output to syslog.

Example

```
EZD1784I Received optional IDr payload but could not find applicable KeyExchangeRule -  
LocalIp : 9.1.1.1 RemoteIp : 9.2.2.2 LocalID : ID_FQDN example.ibm.com  
RemoteID : ID_IPV4_ADDR 9.2.2.2
```

EZD1785I	Tentative KeyExchangeRule <i>rule1</i> replaced with final KeyExchangeRule <i>rule2</i>
-----------------	--

Explanation

When an IKE negotiation is started, the KeyExchangePolicy statement is searched to locate a matching KeyExchangeRule statement for the negotiation. When this KeyExchangeRule statement is located, the local and remote security endpoint identities are not known with certainty, so this KeyExchangeRule statement is considered tentative until the local and remote identities are known. Then a new search for a KeyExchangeRule statement is performed to locate the final rule.

The policy on the final KeyExchangeRule statement must be consistent with the policy chosen for the Security Association. For IKEv1, see the information about [ISAKMP main mode limitations in z/OS Communications Server: IP Diagnosis Guide](#) for more information about IKEv1. For IKEv2, see the information about [key exchange limitations in z/OS Communications Server: IP Diagnosis Guide](#) for more information about IKEv2.

In the message text:

rule

The name of the tentative KeyExchangeRule statement.

rule2

The name of the final KeyExchangeRule statement.

System action

IKE daemon processing continues.

Operator response

None.

System programmer response

None.

User response

Example

```
EZD1785I Tentative KeyExchangeRule ker_dvipa replaced with final KeyExchangeRule ker_dvipa9
```

EZD1786I	Cannot negotiate IKEv1 tunnel for filter rule <i>rule</i>name using specific types or codes
-----------------	--

Explanation

IKEv1 does not support the negotiation of tunnels for specific ICMP types and codes, ICMPv6 types and codes, or MIPv6 types and codes. The filter rule specified by the *rule*name value uses an IpService definition that specifies either individual types and codes or a range of types and codes, for ICMP, ICMPv6, or MIPv6 traffic. A tunnel negotiation was attempted that used the specified filter rule with a KeyExchangeAction statement that requires IKEv1 to initiate the negotiation. Tunnels that use either individual types and codes or a range of types and codes can be negotiated for IKEv2, but not for IKEv1.

In the message text:

***rule*name**
The name of the filter rule.

System action

The tunnel activation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Examine the policy definition for the rule name and modify it to correct the error. Potential changes include:

- Specify HowToInitiateVersion IKEv2.
- Do not code specific values or ranges of ICMP, ICMPv6, or MIPv6 types and codes.

User response

Not applicable.

Problem determination

None.

Example

```
EZD1786I  Cannot negotiate IKEv1 tunnel for filter rule TimestampRequestReply  using specific  
          types or codes
```

EZD1787I

Received unsupported IKEv2 traffic selector specification

Explanation

The Internet Key Exchange (IKE) daemon does not support a traffic selector specification that it received from an IKEv2 peer. The IKE daemon does not support the following types of traffic selectors:

- Traffic selectors that use a distinct set of port values instead of a contiguous range; these traffic selectors are called disjoint traffic selectors. If the peer is acting as an initiator, the IKE daemon attempts to find a pairing of its proposed traffic selectors that is not disjoint. However, if the peer is acting as a responder, the IKE daemon cannot accept a counter-proposal that contains disjoint traffic selectors, so it fails the tunnel activation.
- Traffic selectors that are asymmetrical; for example, traffic selectors that contain ICMP type 13 in one direction, but ICMP type 14 in the other direction. If the peer is acting as an initiator, the IKE daemon attempts to find a pairing of its proposed traffic selectors that is not asymmetrical. If the peer is acting as a responder and its returned traffic selectors are asymmetrical, the IKE daemon fails the tunnel activation.
- Traffic selectors that contain port, type, or code specifications for any protocol other than TCP, UDP, ICMP, ICMPv6, or MIPv6. RFC 5996 *Internet Key Exchange (IKEv2) Protocol* makes provisions for negotiating port, type, and code values for these protocols. If the peer is acting as an initiator, the IKE daemon attempts to find a pairing of its proposed traffic selectors that has recognizable port, type, and code specifications. If the peer is acting as a responder and its returned traffic selectors contain any unrecognized port, type, or code specifications, the IKE daemon fails the tunnel activation. See [Appendix A, “Related protocol specifications,” on page 1471](#) for information about accessing RFCs.

To perform further diagnosis, enable the formatted packet trace option in your `IkeSyslogLevel` configuration settings, and retry tunnel activation. Your syslog contains the exact traffic selector values that the peer is proposing.

System action

The tunnel activation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Contact the administrator of the remote IKE peer node to modify their policies so that the resulting traffic selectors are compatible with the restrictions listed above.

User response

Not applicable.

Problem determination

None.

Source

Descriptor code

7

Automation

This message is output to syslog

Example

```
EZD1787I Received unsupported IKEv2 traffic selector specification
```

EZD1788I	Received an IKEv2 traffic selector in a response that does not match the local proposal
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon proposed a traffic selector specification to the IKEv2 peer, but received a response from the IKEv2 peer whose traffic selectors do not match the proposal that was sent to the peer.

If you enable the formatted packet trace option in your IkeSyslogLevel configuration settings, your syslog contains the exact traffic selector values that the peer is sending for further diagnosis.

System action

The tunnel activation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Contact the administrator of the remote IKE peer node to modify their policies so that the resulting traffic selectors are compatible with the local proposals.

User response

Not applicable.

Problem determination

None.

EZD1788I Received an IKEv2 traffic selector in a response that does not match the local proposal
```

EZD1789I	The remote security endpoint <i>requested_ep</i> is not included within the address <i>rule_ep</i> taken from <i>rule_name</i>
----------	--

Explanation

During the negotiation of a tunnel-mode Security Association (SA) the IKE daemon determined that the requested IP addresses are not included in the security endpoint that the IKE daemon chose from the policy rule or destination address.

In the message text:

requested_ep

The IP address or IP address range endpoint that the endpoint requested for the tunnel-mode SA. The *requested_ep* value is the value configured for the *InitiateToLocation* parameter on the *IpLocalStartAction* statement for the applicable filter rule, or if the *InitiateToLocation* parameter was not configured, the value is the destination data address for the tunnel activation.

rule_ep

The remote security endpoint IP address or IP address range that is configured on the IpLocalStartAction statement for the applicable filter rule.

rule_name

The name of the IpFilterRule statement that is used for the tunnel activation. The IpFilterRule statement refers to an IpLocalStartAction statement that specifies a RemoteSecurityEndpoint parameter with the indicated *rule_ep* value.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the systems programmer. Problem Determination: Not applicable.

System programmer response

Alter the local policy configuration to specify the following:

- An InitiateToLocation value on the applicable IpLocalStartAction statement; the InitiateToLocation value must be within the range of the RemoteSecurityEndpoint location value.
- A RemoteSecurityEndpoint parameter on the applicable IpLocalStartAction statement; the RemoteSecurityEndpoint parameter must encompass the actual remote security endpoint address.

See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

User response

Not applicable.

Problem determination

Not applicable.

taken
      from S4-S5_TIKE1311-5A
```

EZD1790I

Error event IKE version Security Association *sa_generation* for tunnel *tunnel_id*

Explanation

This message indicates that an error occurred while the Internet Key Exchange (IKE) daemon was rekeying or reauthenticating a Security Association (SA).

Additional messages that have the same message instance number are issued to identify the affected SA. The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

event

The event that encountered the error. Possible *event* values are rekeying or reauthenticating.

version

The version of the IKE protocol for the SA.

sa_generation

The number used to differentiate SAs for the same tunnel. The first SA that is created for a tunnel is number 1.

tunnel_id

The tunnel prefix and number used to identify the tunnel. The tunnel prefix is K for an IKE tunnel or Y for a dynamic tunnel.

System action

The reauthentication or rekeying fails. The existing SA might be expired. IKE daemon processing continues.

Operator response

None.

System programmer response

Consult the syslog output to identify other messages that indicate the cause of the error.

User response

Not applicable.

Problem determination

None.

7

Automation

This message is output to syslog.

Example

```
EZD1791I IKE version 2.0 Security Association 1 for tunnel K3 will not be reauthenticated
```

EZD1792I	<i>IKE version version Security Association phase2_generation for tunnel phase2_tunnel_id rekeyed due to reauthentication of Security Association phase1_generation for tunnel phase1_tunnel_id</i>
-----------------	--

Explanation

This message indicates that a phase 2 Security Association (SA) was rekeyed because its associated phase 1 SA was reauthenticated. SAs use secret keys that should be used only for a limited amount of time and to protect a limited amount of data. Rekeying is the reestablishment of SAs to take the place of ones that expire. When a phase 1 SA is reauthenticated, all of its associated phase 2 SAs are rekeyed.

Additional messages that have the same message instance number are issued to identify the affected SA. The message instance number precedes the message number in the log output and is used to group related messages from the Internet Key Exchange (IKE) daemon.

In the message text:

version

The version of the IKE protocol for the SA that was rekeyed.

phase2_generation

The number used to differentiate SAs for the same tunnel. The first SA that is created for a tunnel is number 1.

phase2_tunnel_id

The tunnel prefix and number used to identify a phase 2 tunnel. The tunnel prefix is Y.

phase1_generation

The number used to differentiate SAs for the same tunnel. The first SA that is created for a tunnel is number 1.

phase1_tunnel_id

The tunnel prefix and number used to identify a phase 1 tunnel. The tunnel prefix is K.

System action

IKE daemon processing continues.

EZD1794I	Local activation of a dynamic tunnel failed for <i>proto_name</i> traffic between <i>local_ip</i> <i>local_selector_type</i> <i>local_selector</i> and <i>remote_ip</i> <i>remote_selector_type</i> <i>remote_selector</i>
-----------------	---

Explanation

A local activation of a dynamic tunnel for protecting traffic with the characteristics given failed.

Additional diagnostic messages with the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

proto_name
The protocol of the traffic to be protected by the tunnel.

local_ip
The local IP address of the traffic to be protected by the tunnel.

local_selector_type* and *remote_selector_type

The type of upper-layer selectors to be protected by the tunnel. The selector type value N/A implies that a selector type is not applicable.

local_selector

The upper-layer selector of the local traffic to be protected by the tunnel. The selector value N/A implies that a local selector is not applicable.

remote_ip

The remote IP address of the traffic to be protected by the tunnel.

remote_selector

The upper-layer selector of the remote traffic to be protected by the tunnel. The selector value N/A implies that a remote selector is not applicable.

System action

The SA negotiation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Review additional diagnostic messages to determine the cause of the failure. After resolving the problem, attempt the tunnel activation again.

User response

Not applicable.

Problem determination

None.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

anchor_ureq.cpp

Routing code

11

Descriptor code

7

Automation

This message is output to the syslog.

Example

```
EZD1794I Local activation of a dynamic tunnel failed for UDP(17) traffic between 1.2.0.1 port 2000
and 1.1.0.1 port 3000
```

EZD1794I Local activation of a dynamic tunnel failed for IP(4) traffic between 1.2.0.1 N/A N/A and 1.1.0.1 N/A N/A

EZD1795I

A matching IpFilterRule with an IpDynVpnAction was not found for protecting *proto_name* traffic between *local_ip* *local_selector_type* *local_selector* and *remote_ip* *remote_selector_type* *remote_selector*

Explanation

An IKE negotiation failed because a matching IpFilterRule statement could not be found or because the IpFilterRule statement that was found did not have an associated IpDynVpnAction statement in the policy agent configuration file.

When the connectivity rules in the GUI are configured with the IBM Configuration Assistant for z/OS Communications Server, they correspond to the policy agent configuration IpFilterRule statements. The security levels that use dynamic tunnels in the GUI correspond to the IpDynVpnAction statements.

In the message text:

proto_name

The protocol of the traffic to be protected by the tunnel.

local_ip

The local IP address of the traffic to be protected by the tunnel.

local_selector_type* and *remote_selector_type

The type of upper-layer selectors to be protected by the tunnel. The selector type value N/A means that the selector type is not applicable.

local_selector

The upper-layer selector of the local traffic to be protected by the tunnel. The local selector value N/A means that the local selector is not applicable.

remote_ip

The remote IP address of the traffic to be protected by the tunnel.

remote_selector

The upper-layer selector of the remote traffic to be protected by the tunnel. The remote selector value N/A means that the remote selector is not applicable.

System action

The Security Association (SA) negotiation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

If the specified traffic is to be protected by a dynamic SA, then update the configuration. If the remote system is behind a NAT, ensure that the *remote_ip* in the filter rule is the public address of the peer system. If the remote system is behind a gateway behind a NAT, ensure the *remote_ip* in the filter rule is the public address of the gateway.

If you are updating the configuration without the IBM Configuration Assistant for z/OS Communications Server, update the IpFilterPolicy statement to define an IpFilterRule statement with an IpDynVpnAction statement for the traffic pattern identified in the message. See the information about [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

If you are updating the configuration with the IBM Configuration Assistant for z/OS Communications Server, update the TCP/IP stack connectivity rules so that the specified traffic is protected by a security level that uses a dynamic tunnel. See the online help in the GUI for additional information.

```

EZD1797I	Traffic specification requires NON_FIRST_FRAGMENTS_ALSO but IKEv2 peer did not send it
-----------------	---

Explanation

When an IP packet that has upper-layer transport selectors (TCP port, UDP port, ICMP type and code, or MIPv6 type) is fragmented, only the first fragment contains the transport selectors. The remaining fragments are known as non-first fragments. There are potential security risks when you filter these non-first fragments because the port, type or code values are unknown. Because of these risks, RFC 5996 *Internet Key Exchange (IKEv2) Protocol* requires IKEv2 peers to use the NON_FIRST_FRAGMENTS_ALSO notify payload to negotiate support for non-first fragments. This negotiation determines whether non-first fragments are allowed to be carried on the IPSec Security Association (SA). They are allowed if the SA meets the following criteria:

- The SA is using tunnel mode rather than transport mode.
- The SA applies to TCP, UDP, ICMP, ICMPv6, or MIPv6 traffic and has a port, type or code, specification other than ALL.
- The SA endpoints support stateful fragment checking, or the z/OS end of the SA carries only local traffic. Local traffic is filtered before it is fragmented, so it is not a security risk.

z/OS Communications Server does not implement stateful fragment checking, so it does not require the NON_FIRST_FRAGMENTS_ALSO notify payload for SAs that are carrying routed traffic. However, z/OS Communications Server does require the NON_FIRST_FRAGMENTS_ALSO notify payload for SAs that are carrying local traffic because it sends local non-first fragments over the same SA as the first fragments. If the peer does not include this notify payload, it cannot receive the non-first fragments that the z/OS might send over this SA. z/OS will fail the SA negotiation and generate this message, because the peer is not prepared to receive all possible traffic that z/OS Communications Server might send over the SA.

System action

The SA negotiation fails. The IKE daemon processing continues.

Operator response

None.

System programmer response

Consult the syslog output to identify other messages that indicate which policy rules relate to the error.

To prevent this failure, perform one of the following actions:

- Configure the remote security endpoint to enable stateful fragment checking.
- Configure the SA at both security endpoints to use transport mode rather than tunnel mode.
- Configure the SA at both security endpoints to cover all ports, types, or codes rather than to cover specific ports, types, or codes. To ensure that the SA covers all ports, types, or codes, configure both the IP filter rule and the granularity settings at both security endpoints. The IP filter rule must specify all ports, types, or codes. The on-demand granularity settings for port, type, and code must be set to use the values defined in the IP filter rule rather than the on-demand packet. For z/OS Communications Server, the IP filter rule selectors are configured on the IpService statement and granularity settings are configured on the IpLocalStartAction statement. See the information about the [IpService statement](#) and the [IpLocalStartAction statement](#) in [z/OS Communications Server: IP Configuration Reference](#).

```

EZD1798I

***PolicySource* policy requires the SharedKey parameter but none is specified in KeyExchangeRule KERname**

Explanation

The associated KeyExchangeRule statement for this Internet Key Exchange (IKE) Security Association (SA) negotiation did not specify a shared key to be used in the negotiation. Because a pre-shared key is required and none was given, the negotiation failed.

In the message text:

PolicySource

The *PolicySource* value is either local or remote.

KERname

The KeyExchangeRule name configured in the policy.

System action

The IKE SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Either specify a preshared key to be used in this negotiation on the SharedKey parameter in the KeyExchangeRule statement or specify the use of digital signature authentication. If the PolicySource value is local, you can specify a digital signature authentication method on the HowToAuthMe keyword on the KeyExchangeAction statement that is associated with the specified KeyExchangeRule. If PolicySource is remote and digital signature authentication is preferred to specifying a shared key, reconfigure the IKE peer to use digital signature authentication.

See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

Automation

This message is output to syslog.

Example

```
EZD1798I local policy requires the SharedKey parameter but none is specified in KeyExchangeRule 0~3
```

EZD1799I	IKE cannot initiate with local data addresses <i>ipaddress_range</i> for a Security Association traversing a NAT
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon tried to activate a phase 2 Security Association (SA) that will traverse a network address translation (NAT) device, but the identity specified for the local data endpoint in the policy for this SA defined a range of local IP addresses that is to be protected by the SA. When traversing a NAT, the IP address of the local data endpoint must be specified as a single host address.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

ipaddress_range

The IP address range that was specified for the local data endpoint.

System action

The phase 2 SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Ensure that only single host addresses are specified as data endpoints when traversing a NAT. Notify the administrator of the remote security endpoint and ask the administrator to ensure that only single IPv4 addresses are specified as data endpoints when traversing a NAT.

User response

          traversing a NAT
EZD1799I IKE cannot initiate with local data addresses 9.42.130.0-9.42.130.128 for a Security
Association
          traversing a NAT
```

EZD1800I

Remote security endpoint at *remote_ip* port *remote_port* is using a digital signature for authentication but did not send its certificate in a certificate payload

Explanation

The authentication method that is identified in the authentication payload that was sent by the remote security endpoint uses a digital signature. The Internet Key Exchange (IKE) daemon cannot process that digital signature because the remote security endpoint did not send a certificate payload that contains the certificate that was used to create the digital signature.

In the message text:

remote_ip

The remote security endpoint IP specification.

remote_port

The port of the remote security endpoint.

System action

The IKE SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that it failed to send a certificate payload.

User response

Not applicable.

Problem determination

None.

```

EZD1806I *jobname* **MODIFY COMMAND UNSUCCESSFUL : reason**

Explanation

The Communications Server SMTP (CSSMTP) application MODIFY command did not successfully complete.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

reason

The reason that the MODIFY command failed. Possible values are:

CONFIGURATION NOT INITIALIZED

The CSSMTP application was unable to process this MODIFY command because message EZD1824E was issued and the CSSMTP application is waiting for a TCP/IP stack to start.

INSUFFICIENT STORAGE

There is not enough storage to process this modify request.

UNKNOWN VERB

The command verb is not known. For example: MODIFY *procname*,BADVERB

MISSING VERB

A required command verb is missing. For example: MODIFY *procname*,

UNKNOWN KEYWORD

An unknown or unexpected keyword was specified. For example:

- BADKEY is the unknown keyword, because MODIFY DISPLAY requires an additional keyword, but BADKEY is not a valid keyword for DISPLAY. Example: MODIFY *procname* DISPLAY,BADKEY
- BADKEY2 is an unexpected keyword, because MODIFY REFRESH does not have additional keywords, but BADKEY2 is an unexpected keyword. Example: MODIFY *procname*, REFRESH,BADKEY2

MISSING KEYWORD

A required keyword is missing. For example: MODIFY *procname*,DISPLAY,

MISSING VALUE

A required value is missing. For example: MODIFY *procname*,LOGLEVEL,LEVEL=

INCORRECT VALUE

An incorrect value was specified. For example: MODIFY *procname*,LOGLEVEL,LEVEL=9999

PREVIOUS MODIFY COMMAND IN PROGRESS

A previous MODIFY REFRESH or MODIFY REFRESHLIST command has not completed.

COMMAND OUT OF SEQUENCE

The SUSPEND command and RESUME command were not issued in correct order. The only exception to the sequencing restriction is that a MODIFY SUSPEND,IMMEDIATE command can be issued after a MODIFY SUSPEND,DELAY command.

EXTENDED RETRY NOT ACTIVE

The FLUSHRETRY command with the AGE keyword was issued and the extended retry function is not active.

System action

The CSSMTP MODIFY command is ignored.

Operator response

The operator response is based on the *reason* value:

CONFIGURATION NOT INITIALIZED

Verify whether message EZD1824E is still active. Try the command again after you receive message EZD1840I or EZD1841I.

INSUFFICIENT STORAGE

Inform the system programmer of the storage shortage and try the command again after the storage problem has been relieved.

PREVIOUS MODIFY COMMAND IN PROGRESS

Wait until the previous MODIFY REFRESH or MODIFY REFRESHLIST command has completed before issuing the command again. If the problem persists, then contact the system programmer to determine whether this is a domain name server problem.

All other *reason* values

Verify that the syntax of the MODIFY command is correct and reissue the command. See the information about the MODIFY command: [Communications Server SMTP application \(CSSMTP\) in z/OS Communications Server: IP System Administrator's Commands](#) for the syntax of the command.

If the problem persists, contact the system programmer.

System programmer response

The system programmer response is based on the *reason* value:

INSUFFICIENT STORAGE

See the information about [diagnosing storage abends and storage growth in z/OS Communications Server: IP Diagnosis Guide](#) for more information about storage problems.

PREVIOUS MODIFY COMMAND IN PROGRESS

Examine the log file to determine the cause of the problem. Take the necessary corrective action.

If you need more information to diagnose the errors, restart the CSSMTP application with a minimum of LogLevel 79. See the information about [gathering diagnostic information about CSSMTP problems in z/OS Communications Server: IP Diagnosis Guide](#) to determine what documentation you should obtain before contacting IBM Service.

```

EZD1807I***jobname* ERROR IN INITIALIZATION : *reason***

Explanation

The Communications Server SMTP (CSSMTP) application could not initialize because it detected an error.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

reason

The reason the initialization failed:

CANNOT ACCESS JESSPOOL

The CSSMTP application is not defined for access to SAF JESSPOOL resources.

CANNOT ACCESS SERVAUTH

The CSSMTP application is not defined for access to SAF SERVAUTH resources.

CONFIGURATION FILE ERRORS

The CSSMTP application found an error in the configuration file.

CONFIGURATION FILE NOT AVAILABLE

The CSSMTP application cannot open the configuration file.

CSSMTP JOBNAME ALREADY STARTED

Only one copy of the CSSMTP application can be started with this job name and one copy is already started.

EXTERNAL WRITER NAME *extWrtName* ALREADY IN USE

- Only one copy of the CSSMTP application can be started with this external writer name.
- *extWrtName* is the external writer name.

INTERNAL ERRORS

Indicates an internal error in the application.

INVALID LOG FILE TYPE

The log file format PDS or PDSE is not allowed.

JES NOT AVAILABLE

The CSSMTP application cannot use the functions of JES2 or JES3 subsystems.

LOGFILE NOT AVAILABLE

The CSSMTP application cannot open the log file.

NOT STARTED AS STARTED PROCEDURE

The CSSMTP application can be started only as a started procedure.

START OPTION ERRORS

The CSSMTP application found an error in a start options parameter in the started procedure.

System action

The application ends.

Operator response

The operator response is based on the *reason* value:

CSSMTP JOBNAME ALREADY STARTED

Start this CSSMTP application with a different job name. For example, you could use this form of the start command:

```
s cssmtp.newJobName
```

All other *reason* values

Contact the system programmer.

System programmer response

The system programmer response is based on the *reason* value:

CANNOT ACCESS JESSPOOL

Define CSSMTP with ALTER access to the local-node.** JESSPOOL class resource. See the information about [for setting up security for CSSMTP in z/OS Communications Server: IP Configuration Guide](#) for details about defining the JESSPOOL class profile for the CSSMTP application.

CANNOT ACCESS SERVAUTH

Define CSSMTP with READ access to the EZB.CSSMTP.** SERVAUTH class resource. See the information about [for setting up security for CSSMTP in z/OS Communications Server: IP Configuration Guide](#) for details about defining SERVAUTH class profile for the CSSMTP application.

EXTERNAL WRITER NAME *extWrtName* ALREADY IN USE

Start this CSSMTP application with a different external writer name. See the information about the [ExtWrtName statement in z/OS Communications Server: IP Configuration Reference](#) for information about configuring the CSSMTP application.

CONFIGURATION FILE NOT AVAILABLE

Ensure that the correct configuration file is configured in the CONFIG DD statement. See the information about the [CSSMTP started procedure in z/OS Communications Server: IP Configuration Reference](#) for information about configuring CONFIG DD for the CSSMTP application.

JES NOT AVAILABLE

Ensure that the JES subsystem is configured correctly. See the information about [configuring and starting CSSMTP in z/OS Communications Server: IP Configuration Guide](#) for information about configuring JES subsystems.

CONFIGURATION FILE ERRORS

Examine the log file for the configuration error and correct it. See the information about the [MODIFY command: Communications Server SMTP application \(CSSMTP\) in z/OS Communications Server: IP Configuration Reference](#) for information about configuring the CSSMTP application.

START OPTION ERRORS

Examine STDOUT and correct the start options parameter that is incorrect. See the information about [starting CSSMTP in z/OS Communications Server: IP Configuration Reference](#) for information about the start options for the CSSMTP application.

LOGFILE NOT AVAILABLE

Ensure that the correct log file is configured in the LOGFILE DD statement. See the information about the [CSSMTP started procedure in z/OS Communications Server: IP Configuration Reference](#) for information about configuring LOGFILE DD for the CSSMTP application.

INVALID LOG FILE TYPE

On the LOGFILE DD statement, define a log file type that is not PDS or PDSE. See the information about the [CSSMTP started procedure in z/OS Communications Server: IP Configuration Reference](#) for information about configuring LOGFILE DD for the CSSMTP application.

INTERNAL ERRORS

Examine the log file for the internal error and correct the error if possible.

NOT STARTED AS STARTED PROCEDURE

Start the CSSMTP application as a started procedure. See the information about [configuring and starting CSSMTP in z/OS Communications Server: IP Configuration Guide](#) for details about starting the CSSMTP application.

See the information about [gathering diagnostic information about CSSMTP problems in z/OS Communications Server: IP Diagnosis Guide](#) to determine what documentation you should obtain before contacting IBM Service.

EZD1811I***jobname* CANNOT WRITE TO LOG FILE**

Explanation

The Communications Server SMTP (CSSMTP) application cannot write to the log file configured on the LOGFILE DD in the started procedure. Some common reasons for the failure are that the log file was not large enough or there are system storage problems. This message might be generated when the log level is changed and the error condition still exists. CSSMTP changes the log level dynamically when it starts and stops, so this message can appear multiple times.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

The CSSMTP application continues processing without logging.

Operator response

Contact the system programmer.

System programmer response

See the information about the [CSSMTP started procedure in z/OS Communications Server: IP Configuration Reference](#) for information about configuring LOGFILE DD for the CSSMTP application.

If the storage issue or log file problem is resolved, then issue the MODIFY LOGLEVEL command or the MODIFY REFRESH command to try and restart logging.

User response

Not applicable.

Problem determination

Contact the system programmer.

EZD1815E

***jobname* NO ADDRESSES WERE RESOLVED FROM CONFIGURED
TARGET SERVERS**

Explanation

The Communications Server SMTP (CSSMTP) application detected that no IP addresses were resolved from all TargetName or TargetMx statements in the configuration file.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

The CSSMTP application will periodically try to resolve addresses again from configured target servers. The application suspends processing until at least one IP address is available. The message will clear when at least one IP address can be resolved.

Operator response

Contact the system programmer.

System programmer response

Determine if the resolver is initialized.

- If the resolver is not initialized, start the resolver.
- If the resolver is initialized, ensure that the names specified on the TargetServer statement are correct.

- If the specified names are correct, then there might be a problem in the domain name server setup or the resolver setup. See the information about [diagnosing resolver problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#).

After the problem is corrected by fixing the domain name server setup or the resolver setup, then issue the resolver MODIFY REFRESH command to cause the next resolver request to use the updated domain name server setup or resolver setup, and reissue the MODIFY REFRESHLIST command to resolve the target servers again.

- If the specified names are not correct, then correct them and reissue the MODIFY REFRESH command.

If problems persist, then see the information about [gathering diagnostic information about CSSMTP problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#) to determine what documentation you should obtain before contacting IBM Service.

User response

Not applicable.

Problem determination

See the system programmer response.

SPOOL FILE DISPOSITION IS DELETE**

Explanation

The Communications Server SMTP (CSSMTP) application completed processing a JES spool file for the job. The disposition of the spool file was changed to DELETE. An error report might be generated, based on the REPORT configuration statement in the configuration file.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

jesjobname

The job name of the JES spool file.

jesjobid

The JES job ID of the spool file.

wrtname

The writer name of the JES spool file.

System action

The sysout spool file is deleted

Operator response

Contact the system programmer.

System programmer response

The mail administrator should inspect the notification or log file for error messages. If you need more information to diagnose the error, issue MODIFY LOGLEVEL,LEVEL=31 to change the log level value.

User response

See the system programmer response.

Problem determination

See the system programmer response.

Example

```
EZD1816I CSSMTP USER41P / JOB00116 ON XYZ COMPLETED WITH ERRORS. SPOOL FILE DISPOSITION IS DELETE
```

EZD1817I

jobname* UNABLE TO CONNECT TO TARGET SERVER *ipaddress

Explanation

The Communications Server SMTP (CSSMTP) application cannot connect to the specified target server IP address.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

ipaddress

The IP address of the target server.

System action

The CSSMTP application attempts to connect to another configured target server IP address. CSSMTP will periodically try to connect to this target server IP address based on the configured TIMEOUT ConnectRetry value.

If the CSSMTP application connects to the target server, then message EZD1821I is issued to display the IP address of the target server.

Operator response

Contact the system programmer.

System programmer response

If the IP address that is displayed in this message is not correct, then issue the MODIFY DISPLAY,IPLIST command to determine whether the IP address was specified in the configuration file or was the result of a host name or MX name resolution. If you change the IP address, host name, or MX name in the configuration file, then issue a MODIFY REFRESH command to update the configuration settings. If the IP address is incorrect and is the result of a name resolution, then diagnose the resolver or Domain Name System (DNS) problems. If the IP address displayed in this message is correct, then check for network connectivity problems.

Examine the log file to determine the cause of the problem. Take the necessary corrective action based on the log information that indicates the cause of the failure. If you need more information to diagnose the error, issue MODIFY LOGLEVEL,LEVEL=47 to change log level value. Check the application trace log for failures. Send a ping to the target server IP address from the system. If the ping works, check the configured port for this target server and ensure that the remote SMTP server is running and listening on that port.

See the information about [gathering diagnostic information about CSSMTP problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#) to determine what documentation you should obtain before contacting IBM Service.

12

Automation

This message is written to the system console and log file for CSSMTP. This message is a good candidate for automation. Automation can alert you to the need to take corrective action when CSSMTP is not able to send any mail to this IP address.

Example

```
EZD1817I CSSMTP1 UNABLE TO CONNECT TO TARGET SERVER 9.1.1.1
```

EZD1818I *jobname UNABLE TO SEND TO TARGET SERVER ipaddress*

Explanation

The Communications Server SMTP (CSSMTP) application cannot send mail to the target server IP address. Errors occurred after the connection to the target server was successful but before a successful EHLO or HELO SMTP command response was received.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

ipaddress

The IP address of the target server.

System action

The CSSMTP application attempts to send mail to another target server IP address, if one is available. CSSMTP periodically tries to establish communication with this target server IP address, based on the configuration statement TIMEOUT ConnectRetry value, because the connection must be re-established. If the CSSMTP application connects to the target server, then message EZD1821I is issued to display the IP address of the target server.

Operator response

Contact the system programmer.

System programmer response

If the IP address that is displayed in this message is not correct, then issue the MODIFY DISPLAY,IPLIST command to determine whether the IP address was specified in the configuration file or was the result of a host name or MX name resolution. If you change the IP address, host name, or MX name in the configuration file, then issue a MODIFY REFRESH command to update the configuration settings. If the IP address is incorrect and is the result of a name resolution, then diagnose the resolver or Domain Name System (DNS) problems. If the IP address displayed in this message is correct, then check for network connectivity problems.

Examine the log file to determine the cause of the problem. Take the necessary corrective action. If you need more information to diagnose the error, issue MODIFY LOGLEVEL,LEVEL=47 to change log level value. Check the application trace log for failures. Try pinging the target server IP address from the system. If the ping works, check the configured port for this target server and ensure that the remote SMTP server is running and listening

on that port. For example, if the server is running but does not send the protocol greeting after a successful connect() call, the server that is using the port might not be an SMTP server.

See the information about [gathering diagnostic information about CSSMTP problems in z/OS Communications Server: IP Diagnosis Guide](#) to determine what documentation you should obtain before contacting IBM Service.

User response

Not applicable.

Problem determination

See the system programmer response.

12

Automation

This message is written to the system console and log file for CSSMTP. This message is a good candidate for automation. Automation can alert you to the need to take corrective action when CSSMTP is not able to send any mail to this IP address.

Example

```
EZZ1818I CSSMTP1 UNABLE TO SEND TO TARGET SERVER 9.1.1.1
```

EZD1819I	<i>jobname</i> UNABLE TO ESTABLISH A TLS CONNECTION TO TARGET SERVER <i>ipaddress</i>
-----------------	--

Explanation

The Communications Server SMTP (CSSMTP) application was unable to establish a TLS connection to the target server IP address. Possible causes might be that TLS is not supported on the target server, that security certificates need updating, or that the Policy Agent is not started.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

ipaddress

The IP address of the target server.

System action

The CSSMTP application attempts to find another configured target server IP address that supports TLS. CSSMTP periodically tries to establish a TLS connection to this target server IP address based on the configuration statement TIMEOUT ConnectRetry value.

Operator response

Contact the system programmer.

System programmer response

If the IP address displayed in this message does not require security, then change the configuration TARGETSERVER statement SECURE parameter value to NO in the configuration file and issue a MODIFY REFRESH command to update the configuration settings. If the IP address displayed in this message does require security, then check for other problems such as a server capability that needs updating, security certificates that need updating, or a Policy Agent that is not started.

Examine the log file to determine the cause of the problem. Take the necessary corrective action based on the log information that indicates the cause of the failure. If you need more information to diagnose the error, issue MODIFY LOGLEVEL,LEVEL=47 to change log level value. Check the application's trace log for failures.

See the information about [gathering diagnostic information about CSSMTP problems in z/OS Communications Server: IP Diagnosis Guide](#) to determine what documentation you should obtain before contacting IBM Service.

User response

Not applicable.

Problem determination

See the system programmer response.

12

Automation

This message is written to the system console and log file for CSSMTP. This message is a good candidate for automation. Automation can alert you to the need to take corrective action when CSSMTP is not able to send any mail to this IP address.

Example

```
EZD1819I CSSMTP1 UNABLE TO ESTABLISH A TLS CONNECTION TO TARGET SERVER 9.1.1.1
```

Explanation

The Communications Server SMTP (CSSMTP) application detected that there is no configured target server that is capable of receiving messages at this time.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

The CSSMTP application is unable to get any target server to take mail at this time. CSSMTP periodically tries to communicate with the configured target servers. This message will clear when CSSMTP can communicate with at least one target server IP address.

Operator response

Contact the system programmer.

System programmer response

Check the system console log first for message EZD1824E to determine whether the application can communicate with a TCP/IP stack. If stack communication is not the problem, continue to check the system console log to determine whether message EZD1817I, EZD1818I, or EZD1819I was issued before this message. There might be more than one of these messages, depending on the number of server target IP addresses that are currently being used by the application.

Examine the log file to determine the cause of the problem. Take the necessary corrective action. If you need more information to diagnose the error, issue MODIFY LOGLEVEL,LEVEL=47 to change log level value. Check the application trace log for failures.

See the information about [gathering diagnostic information about CSSMTP problems in z/OS Communications Server: IP Diagnosis Guide](#) to determine what documentation you should obtain before contacting IBM Service.

EZD1823I CSSMTP1 MODIFY FLUSHRETRY,AGE=1 COMMAND COMPLETED
```

EZD1824E

***jobname* WAITING FOR A TCPIP STACK**

Explanation

The Communication Server SMTP (CSSMTP) application cannot communicate with a TCP/IP stack. This message might be issued during CSSMTP initialization or during mail processing.

There are four possible causes of this error:

-p *tcpStack*

The start option stack is not available.

_BPXX_SETIBMOPT_TRANSPORT *tcpStack*

The environment variable stack is not available.

No TCP/IP affinity

No stack is available.

EZB.STACKACCESS

Stack security settings prevent communication with a stack.

See the information about [starting CSSMTP](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about stack affinity.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

CSSMTP initialization or mail processing does not complete and CSSMTP periodically tries to communicate with a stack. This message will clear after CSSMTP connects to the TCP/IP stack.

Operator response

Save the log file and contact the system programmer.

System programmer response

Examine the log file to help determine the cause of the problem and which stack needs to be started. Based on the following, take the necessary corrective action:

- If you are using the -p start option, then verify that the specified stack is started.
- If you are using the _BPXX_SETIBMOPT_TRANSPORT environment variable, then verify that the stack configured on the environment variable is started.
- If you are not using TCP/IP affinity, then verify that a stack is available.
- If you are restricting stack access by using the SERVAUTH class resource EZB.STACKACCESS then verify that the CSSMTP application has authority to access to the resource.

If you need more information during mail processing time to diagnose the warnings, issue MODIFY LOGLEVEL,LEVEL=79 to increase the log level. Check the application trace log for failures when performing the TCP/IP socket() function. The inability to obtain a socket blocks communication between the application and the TCP/IP stack.

User response

Not applicable.

Problem determination

None.

Example

```
EZD1824E CSSMTP1 WAITING FOR A TCPIP STACK
```

EZD1825I *jobname* JES NOT AVAILABLE

Explanation

The Communications Server SMTP (CSSMTP) application is ending because JES2 or JES3 subsystems are no longer available.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

The CSSMTP application ends.

Operator response

If the JES2 or JES3 subsystem was not stopped, contact the system programmer. If the system programmer indicates that more information is required in the CSSMTP log file, restart CSSMTP with the minimum value LOGLEVEL,LEVEL=95 configured in the main configuration file. If the JES2 or JES3 subsystems were stopped, restart them before restarting CSSMTP.

System programmer response

Examine the log file to determine the cause of the problem. Take the necessary corrective action and restart CSSMTP. If you need more information to diagnose the errors, restart CSSMTP with the minimum value LOGLEVEL,LEVEL=95. If the log shows SAPI rc=0 SSOBRETN=32 SSS2REAS=36 and the JES2 DESTDEF statement specifies NODENAME=REQUIRED, you must define the writer name specified in the ExtWrtName statement to JES2. You can dynamically define it to JES using the command

```
$ADD DESTID(xxxxxxxx),DEST=xxxxxxxx,
```

where xxxxxxxx is the *wtrName* value specified in the ExtWrtName statement. See [z/OS JES2 Initialization and Tuning Reference](#) for information about the DESTDEF statement. To permanently add the destination, use the JES initialization DESTid statement: DESTID(xxxxxxxx) DEST=xxxxxxxx. See [DESTid\(xxxxxxxx\) - Route Code Name](#) in [z/OS JES2 Initialization and Tuning Reference](#) for information about the DESTID JES2 statement. See the information about [gathering diagnostic information about CSSMTP problems](#) in [z/OS Communications Server: IP Diagnosis Guide](#) to determine what documentation you should obtain before contacting IBM Service.

Example

```
EZD1825I CSSMTP1 JES NOT AVAILABLE
```

EZD1826I	<i>jobname</i> CANNOT WRITE TO z/OS UNIX FILE SYSTEM DEAD LETTER DIRECTORY
-----------------	---

Explanation

The Communications Server SMTP (CSSMTP) application cannot write to the configured or default z/OS UNIX file system dead letter directory.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

The CSSMTP application continues processing without storing dead letters and the DeadLetterAction configuration statement is set to Delete.

Operator response

Contact the system programmer.

System programmer response

Possible reasons for this message are:

- The UNIX file system dead letter directory is full or nearly full.
- The UNIX file system dead letter directory is not accessible in write mode.

If you determine that the dead letter directory is full or nearly full, then do one of the following:

- Perform the following steps to free some space in the directory
 1. Issue the MODIFY SUSPEND command to suspend new spool file processing.
 2. Delete all unneeded dead letters.
 3. Issue the MODIFY REFRESH command to enable the application to write dead letters into the configured or default directory again.
 4. Issue the MODIFY RESUME command to resume new spool file processing.
- Perform the following steps to use a larger directory:
 1. Allocate a larger z/OS UNIX file system for the dead letter directory.
 2. Change the DeadLetterDirectory configuration statement to specify the new directory.
 3. Issue a MODIFY REFRESH command to use the larger directory.

If you determine that the UNIX file system dead letter directory is not accessible in write mode, perform the following steps:

1. Do one of the following:
 - Mount the UNIX file system in write mode.

- Specify a directory to which you have write access in the DeadLetterDirectory configuration statement in the CSSMTP configuration file.

2. Issue a MODIFY REFRESH command to use the new directory.

See the information about the [UNDELIVERABLE statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about z/OS UNIX file system dead letter directory.

User response

Not applicable.

12

Automation

This message is written to the system console and log file for CSSMTP. This message is a good candidate for automation. Automation can alert you to when CSSMTP has stopped storing dead letters into the z/OS UNIX file system dead letter directory.

Example

```
EZD1826I CSSMTP1 CANNOT WRITE TO z/OS UNIX FILE SYSTEM DEAD LETTER DIRECTORY
```

EZD1827I *jobname* CANNOT WRITE TO THE z/OS UNIX FILE SYSTEM MAIL
DIRECTORY RETURN CODE *errno* REASON CODE *errnojr*

Explanation

The Communications Server SMTP (CSSMTP) application cannot write to the configured or default z/OS UNIX file system mail directory associated with the EXTENDEDRETRY statement.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the [Return codes \(errno\)](#) in [z/OS UNIX System Services Messages and Codes](#).

errnojr

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [Return codes \(errno\)](#) information in the [z/OS UNIX System Services Messages and Codes](#), where the reason codes are listed.

System action

The CSSMTP application stops.

Operator response

Contact the system programmer.

System programmer response

Check the CSSMTP log for the errno/errnojr associated with the I/O error on the MailDirectory parameter. Look up the return code and reason code values to determine the next action to take. Take corrective action and restart CSSMTP.

If you determine that the z/OS UNIX file system mail directory is not accessible in write mode, perform one of the following steps:

- Mount the z/OS UNIX file system in write mode. Restart the CSSMTP application.
- Specify a new directory on the MailDirectory parameter of the ExternalRetry configuration statement in the CSSMTP configuration file. This directory must be one to which CSSMTP will have write access.

See the [ExtendedRetry statement in z/OS Communications Server: IP Configuration Reference](#) for more information about the z/OS UNIX file system mail directory.

REASON CODE EF086015
```

EZD1828I

jobname* DISPLAY LOGLEVEL = *loglevel

Explanation

The message is issued in response to a Communications Server SMTP (CSSMTP) application MODIFY *jobname*,DISPLAY,LOGLEVEL command.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

loglevel

The current log level value that is in effect. This value is specified with the LogLevel configuration statement or with the MODIFY LOGLEVEL,LEVEL command.

The value displayed is the arithmetic sum of the currently active values from the following list.

0

None. No messages are logged.

1

Error-level messages are logged.

2

Warning-level messages are logged.

4

Event-level messages are logged.

8

Info-level messages are logged.

16

Message-level JES (spool) messages are logged. This level traces the CSSMTP commands and command syntax parser replies between the spool and CSSMTP.

32

Message-level TCP/IP messages are logged. This level traces the CSSMTP commands and remote SMTP server replies between CSSMTP and the TCP/IP network.

64

Debug-level messages are logged. These are internal debug messages intended for development and IBM service use only.

128

Trace-level messages are logged. These are function entry and exit traces that show the path through the code. This level is intended for development and IBM service use only.

```

EZD1835I *jobname* **CHKPOINT DD NOT FOUND. CHECKPOINT FUNCTION NOT AVAILABLE**

Explanation

The CHKPOINT data definition statement was missing or the data set name was NULLFILE in the Communications Server SMTP (CSSMTP) started procedure.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

The CSSMTP application continues without checkpoint functions.

Operator response

Contact the system programmer.

System programmer response

If you want the checkpoint functions, then define the checkpoint data set and update the CSSMTP started procedure. See the information about the CSSMTP started procedure in [z/OS Communications Server: IP Configuration Reference](#) for information about configuring CHKPOINT DD for the CSSMTP application.

Example

```
EZD1835I CSSMTP CHKPOINT DD NOT FOUND. CHECKPOINT FUNCTION NOT AVAILABLE
```

EZD1836I

jobName **CHECKPOINT FAILED. REASON CODE = *reasonCode***

Explanation

There was a failure while the Communications Server SMTP (CSSMTP) application checkpoint function was initializing.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

reasonCode

A code describing the error. Possible values are:

12

Locks could not be initialized.

14

Storage was not available.

30

The checkpoint file was not available.

31

The VSAM linear data set could not be connected to the application.

System action

The application ends.

Operator response

Contact the system programmer.

System programmer response

Use the log to determine the exact failure. Ensure that the LogLevel includes ERROR.

User response

Not applicable.

Problem determination

Check the console log for additional messages, for example message IEC161I. Check the log for Checkpoint Open messages.

Example

```
f cssmtp1,refreshiplist
EZD1834I CSSMTP1 MODIFY COMMAND ACCEPTED
EZD1843I CSSMTP1 TARGET SERVERS UNCHANGED
EZD1842I CSSMTP1 MODIFY REFRESHLIST COMMAND COMPLETED
```

EZD1844I *jobname* **TARGET SERVERS UNCHANGED WITH WARNINGS**

Explanation

The Communications Server SMTP (CSSMTP) application processed the TargetServer statements in the configuration file as a result of the MODIFY REFRESH command or MODIFY REFRESHIPLIST command. No updated IP addresses were resolved from the TargetServer statements. The current IP addresses will continue to be used. Warnings were issued as a result of processing the TargetServer statements.

The target name on a TargetServer statement might have resulted in one of the following:

- A target name that could not be resolved to any IP address
- A target name that was resolved to more than 4 IP addresses

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

CSSMTP processing continues.

Operator response

Save the system log for problem determination and contact the system programmer.

System programmer response

Examine the log file to determine the cause of the WARNING messages in the log. These warnings might not cause the CSSMTP application to be unable to deliver mail, but they might indicate problems.

Ensure that the names specified on the TargetServer statement are correct.

- If the specified names are correct, then there might be a problem in the domain name server setup or the resolver setup. See the information about [diagnosing resolver problems in z/OS Communications Server: IP Diagnosis Guide](#) for information about domain name server or resolver problems. After you correct the problem by fixing the domain name server setup or the resolver setup, then issue the resolver MODIFY REFRESH command to cause the next resolver request to use the updated domain name server setup or the resolver setup, and reissue the MODIFY REFRESHIPLIST command to resolve the target servers again.
- If the specified names are not correct, then correct them and reissue the MODIFY REFRESH command.

If problems persist, then see the information about [gathering diagnostic information about CSSMTP problems in z/OS Communications Server: IP Diagnosis Guide](#) to determine what documentation you should obtain before contacting IBM Service.

User response

EZD1842I CSSMTP1 MODIFY REFRESHIPLIST COMMAND COMPLETED
```

EZD1845I	<i>jobname</i> TARGET SERVERS NOT UPDATED BECAUSE OF RESOLVER ERRORS
-----------------	---

Explanation

The Communications Server SMTP (CSSMTP) application processed the TargetServer statements in the configuration file as a result of the MODIFY REFRESH command or MODIFY REFRESHIPLIST command. No IP addresses were resolved from the TargetServer statements. The current IP addresses will continue to be used.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

CSSMTP processing continues.

Operator response

Save the system log for problem determination and contact the system programmer.

System programmer response

Examine the log file to determine the cause of the ERROR messages in the log. These errors might not cause the CSSMTP application to be unable to deliver mail, but they might indicate problems.

Determine whether the resolver is initialized.

- If the resolver is not initialized, start the resolver.
- If the resolver is initialized, ensure that the names specified on the TargetServer statement are correct.
 - If the specified names are correct, then there might be a problem in the domain name server setup or the resolver setup. See the information about [diagnosing resolver problems](#) in *z/OS Communications Server: IP Diagnosis Guide* for information about domain name server or resolver problems. After you correct the problem by fixing the domain name server setup or the resolver setup, then issue the resolver MODIFY REFRESH command to cause the next resolver request to use the updated domain name server setup or resolver setup, and reissue the MODIFY REFRESHIPLIST command to resolve the target servers again.
 - If the specified names are not correct, then correct them and reissue the MODIFY REFRESH command.

```

EZD1847I***jobname* UPDATED TARGET SERVERS WITH WARNINGS**

Explanation

The Communications Server SMTP (CSSMTP) application processed the TargetServer statements during initialization of the application or as a result of the MODIFY REFRESH command or MODIFY REFRESHIPLIST command. IP addresses and their attributes were updated as a result of the TargetServer statements. Warnings were issued as a result of processing TargetServer statements.

The target name on a TargetServer statement might have resulted in one of the following:

- A target name that could not be resolved to any IP address.
- A target name that was resolved to more than 4 IP addresses.
- Configured or resolved IP addresses that exceeded the maximum of 4.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

CSSMTP processing continues.

Operator response

Save the system log for problem determination and contact the system programmer.

System programmer response

Examine the log file to determine the cause of the WARNING messages in the log. These warnings might not cause the CSSMTP application to be unable to deliver mails, but they might indicate problems.

Ensure that the names specified on the TargetServer statement are correct.

- If the specified names are correct, then there might be a problem in the domain name server setup or the resolver setup. See the information about [diagnosing resolver problems in z/OS Communications Server: IP Diagnosis Guide](#) for information about domain name server or resolver problems. After you correct the problem by fixing the domain name server setup or the resolver setup, then issue the resolver MODIFY REFRESH command to cause the next resolver request to use the updated domain name server setup or resolver setup, and reissue the MODIFY REFRESHLIST command to resolve the target servers again.
- If the specified names are not correct, then correct them and reissue the MODIFY REFRESH command.

EZD1848I CSSMTP1 MODIFY REFRESH COMMAND COMPLETED
```

Explanation

The Communications Server SMTP (CSSMTP) application attempted to restart the named spool file as a result of a warm start. CSSMTP was previously running with checkpointing enabled. The spool file was unavailable.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

jesjobname

The job name of the JES spool file.

jesjobid

The JES job ID of the spool file.

wrtname

The writer name of the JES spool file.

System action

Processing continues without the spool file.

Operator response

Contact the system programmer

System programmer response

Determine the status of the spool file. The spool file must have the same writer name or destination that it had when the spool file was first processed by the CSSMTP application.

User response

Not applicable.

Problem determination

Use the System Display and Search Facility (SDSF) to determine the status of the spool file.

EDC8122I No buffer space available. (errno2=0x0000006B)
```

EZD1852I *jobname* NO SPACE IN THE z/OS UNIX FILE SYSTEM MAIL DIRECTORY

Explanation

The Communications Server SMTP (CSSMTP) application cannot write to the configured or default z/OS UNIX file system mail directory associated with the ExtendedRetry statement because the directory is full or nearly full.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

The CSSMTP application stops.

Operator response

Contact the system programmer.

System programmer response

The extended retry function of the Communication Server SMTP (CSSMTP) application requires a UNIX file system mail directory to work correctly. Because the z/OS UNIX file system mail directory is full or nearly full, free some space in the directory or allocate a larger one.

Do one of the following tasks:

- Perform the following steps to free some space in the directory:
 1. Delete files in the z/OS UNIX file system that are not associated with the mail directory. If you need to delete mail files in the mail directory, you must delete both the .cf files and the .df files that are associated with the mail message. The mail associated with these files is lost.
 2. Restart the CSSMTP application.
- Perform the following steps to use a larger directory:
 1. Allocate a larger z/OS UNIX file system for the new mail directory.
 2. Copy the files from the old mail directory to the new mail directory.
 3. Change the MailDirectory parameter in the ExternalRetry configuration statement to specify the new directory.
 4. Restart the CSSMTP application.

See the ExtendedRetry statement in [z/OS Communications Server: IP Configuration Reference](#) for more information about the z/OS UNIX file system mail directory.

User response

Not applicable.

Problem determination

Not applicable.

12

Automation

This message is written to the system console and log file for CSSMTP. This message is a good candidate for automation. Automation can alert you when CSSMTP has a problem storing mails into the z/OS UNIX file system mail directory.

Example

```
EZD1852I CSSMTP1 NO SPACE IN THE z/OS UNIX FILE SYSTEM MAIL DIRECTORY
```

EZD1856I *jobname* JES TASK SHORTAGE DETECTED

Explanation

The Communications Server SMTP (CSSMTP) application detected that over 75% of DEST JES tasks or over 75% of WRITER JES tasks are waiting for long retry processing to complete for one or more mail messages in a JES spool file.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

Processing continues.

Operator response

Contact the system programmer.

System programmer response

Determine whether you need to issue the MODIFY FLUSHRETRY or the MODIFY SUSPEND command.

1. Issue the MODIFY DISPLAY,SPOOLSTATUS,SUMMARY command to determine the number of mail messages that are in the pending or long retry state for each JES task. From the summary report, obtain the TKID value that has pending or long retry mail messages, then issue the MODIFY D,SPoolstatus,Detail,TKID=*tkid* command to display detail information for the specific JES task. See the information about the MODIFY command: [Communications Server SMTP application \(CSSMTP\) information in z/OS Communications Server: IP System Administrator's Commands](#) for an example of the MODIFY DISPLAY,SPOOLSTATUS, command display.
2. Do one of the following:
 - If there are few mail messages in long retry state for a large spool file, issue the MODIFY FLUSHRETRY command to force those long retry mail messages to be tried again immediately. If that retry fails, mail messages will become undeliverable mail. The JES task will then be freed to process other JES spool files.
 - If there is a large number of mail messages in long retry state, then there might be a problem with the mail servers. Issue the MODIFY SUSPEND command to suspend new JES spool file processing until the problem is resolved. If message EZD1817I, EZD1818I, or EZD1819I is in the log, they might help to determine the problem. See [EZD1817I](#), [EZD1818I](#), or [EZD1819I](#) for more detail.

User response

Not applicable.

Problem determination

See the system programmer response.

Source

z/OS Communications Server TCP/IP: CSSMTP

Module

ezamlhck

Routing code

10

Descriptor code

12

Automation

This message is written to the system console and log file for CSSMTP. This message is a good candidate for automation. Automation can alert you to when JES tasks become unavailable to process the JES spool file.

Example

```
EZD1856I CSSMTP1 JES TASK SHORTAGE DETECTED
```

```
EZD1857I jobname JES TASK SHORTAGE RELIEVED
```

Explanation

The Communications Server SMTP (CSSMTP) application detected that less than 50% of DEST JES tasks and less than 50% of WRITER JES tasks are waiting for long retry processing to complete for one or more mail messages in a JES spool file. The previous JES tasks shortage is relieved.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

Processing continues.

Operator response

Contact the system programmer.

System programmer response

Determine whether you need to issue the MODIFY RESUME command.

1. Issue the MODIFY DISPLAY,SPOOLSTATUS,SUMMARY command to determine the state of the JES tasks. See the information about the [MODIFY command: Communications Server SMTP application \(CSSMTP\)](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for an example of the MODIFY DISPLAY,SPOOLSTATUS command display.
2. If the state is SUPND, this indicates that a MODIFY SUSPEND command was issued to suspend the JES tasks. Issue a MODIFY RESUME command to resume the processing for new JES spool files.

User response

Not applicable.

Problem determination

See the system programmer response.

Source

z/OS Communications Server TCP/IP: CSSMTP

Module

ezamlhck

Routing code

10

Descriptor code

12

Automation

This message is written to the system console and log file for CSSMTP. This message is a good candidate for automation. Automation can alert you to when JES tasks are available to process new JES spool files.

Example

```
EZD1857I CSSMTP1 JES TASK SHORTAGE RELIEVED
```

EZD1858I *jobname* STORAGE SHORTAGE DETECTED IN THE *addrJobName*
ADDRESS SPACE

Explanation

The Communications Server SMTP (CSSMTP) application detected that storage use in the CSSMTP application address space exceeds 75%.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

addrJobName

The job name of the address space. This name matches the job name of the started CSSMTP application.

System action

Processing continues.

Operator response

Contact the system programmer.

System programmer response

Perform the following steps to determine the problem:

1. Issue the MODIFY D,SPOOLSTATUS,SUMMARY command to determine the number of mail messages that are in the pending or long retry state for each JES task. From the summary report, obtain the TKID value that has pending or long retry mail messages, then issue the MODIFY D,SPOOLSTATUS,DETAIL,TKID=*tkid* command to display detail information for the specific JES task.
2. Do one of the following:
 - If there are few mail messages in long retry for a large spool file, you can issue the MODIFY FLUSHRETRY command to force those long retry mail messages to be tried again immediately. If that retry fails, mail messages will become undeliverable mail. The JES task will be freed to process other JES spool files and the large spool file will also be freed.
 - If there is a large number of mail messages in long retry, then there might be a problem with the mail servers. You can issue the MODIFY SUSPEND command to suspend new JES spool file processing until the problem is resolved. If messages EZD1817I, EZD1818I or EZD1819I are in the log, they might help you to determine the problem. See [EZD1817I](#), [EZD1818I](#), or [EZD1819I](#) for more detail.
 - If there are several large spool files in progress, then you can issue the MODIFY SUSPEND command to suspend new JES spool file processing until the storage problem is relieved.

Automation

This message is written to the system console and log file for CSSMTP. This message is a good candidate for automation. Automation can enable you to automatically monitor storage use in the CSSMTP application address space.

Example

```
EZD1858I CSSMTP1 STORAGE SHORTAGE DETECTED IN THE CSSMTP1 ADDRESS SPACE
```

EZD1859I	<i>jobname</i> STORAGE SHORTAGE RELIEVED IN THE <i>addrJobname</i> ADDRESS SPACE
-----------------	---

Explanation

The Communications Server SMTP (CSSMTP) application detected that storage use in the CSSMTP application address space has dropped to less than 50%. The previous storage shortage is relieved.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

addrJobname

The job name of the address space. This name matches the job name of the started CSSMTP application.

System action

Processing continues.

Operator response

Contact the system programmer.

System programmer response

Determine whether you need to issue the MODIFY RESUME command.

1. Issue the MODIFY D,SPOOLSTATUS,SUMMARY command to see the state of the JES tasks.
2. If the state is SUPND, this indicates that a MODIFY SUSPEND command was issued to suspend the JES tasks. Issue a MODIFY RESUME command to resume the processing for new JES spool files.

User response

Not applicable.

Problem determination

See the system programmer response.

Automation

This message is written to the system console and log file for CSSMTP. This message is a good candidate for automation. Automation can enable you to automatically monitor storage use in the CSSMTP application address space.

Example

```
EZD1859I CSSMTP1 STORAGE SHORTAGE RELIEVED IN THE CSSMTP1 ADDRESS SPACE
```

EZD1860I	<i>jobname</i> STORAGE SHORTAGE DETECTED IN THE z/OS UNIX FILE SYSTEM DEAD LETTER DIRECTORY
-----------------	--

Explanation

The Communications Server SMTP (CSSMTP) application detected that storage use in the z/OS UNIX file system dead letter directory exceeds 75%.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

Processing continues.

Operator response

Contact the system programmer.

System programmer response

A possible cause for this error is that the UNIX file system that contains the dead letter directory is full or nearly full. If this is the cause of the error, perform one of the following:

- Determine what can be deleted in the file system and delete it.
- Change the DeadLetterDirectory configuration statement to be a directory on a different file system and issue a MODIFY REFRESH command to use the new directory.

If the problem persists, then either issue a MODIFY SUSPEND command or change the DeadLetterAction configuration statement to DELETE.

Determine whether you need to issue the MODIFY SUSPEND command.

1. Issue the MODIFY D,SPOOLSTATUS,SUMMARY command to determine the number of mail messages that are in the pending or long retry state for each JES task. From the summary report, obtain the TKID value that has pending or long retry mail messages, then issue the MODIFY D,SPOOLSTATUS,DETAIL,TKID=*tkid* command to display detail information for the specific JES task.
2. If there is a large number of mail messages in long retry, then there might be a problem with the mail servers. Issue the MODIFY SUSPEND command to suspend new JES spool file processing until the problem is resolved. If messages EZD1817I, EZD1818I or EZD1819I are in the log, they might help in determining the problem. See [EZD1817I](#), [EZD1818I](#), or [EZD1819I](#) for more information.
3. Delete all unneeded dead letters to free some space in the z/OS UNIX file system dead letter directory.

See the information about the [UNDELIVERABLE](#) statement in [z/OS Communications Server: IP Configuration Reference](#) for more information about z/OS UNIX file system dead letter directory.

User response

```

EZD1862I

***jobname* STORAGE SHORTAGE DETECTED IN THE z/OS UNIX FILE
SYSTEM MAIL DIRECTORY**

Explanation

The Communications Server SMTP (CSSMTP) application detected that storage use in the z/OS UNIX file system mail directory associated with the ExtendedRetry statement exceeds 75%.

In the message text:

jobname

The job name of the task that started the CSSMTP application.

System action

Processing continues.

Operator response

Contact the system programmer.

System programmer response

This error indicates that the UNIX file system that contains the mail directory is nearly full. If the mail directory reaches this condition, the CSSMTP application will stop. To prevent CSSMTP from stopping, perform one of the following actions:

- Delete any files in the file system that you no longer need. Do not delete any files from the mail directory.
- If target servers are available and receiving mail, use the MODIFY FLUSHRETRY,AGE=*days* operator command so that older mail messages can be processed from the mail directory.

If the problem persists, you can perform the following steps to stop the CSSMTP application and move the mail directory to a different file system with more space.

1. Use the mkdir command to define the new directory.
2. Copy the existing files from the old directory to the new directory.
3. Update the MailDirectory parameter on the ExtendedRetry configuration statement to specify the new directory.
4. Restart the CSSMTP application.

If the storage shortage for the z/OS Unix file system that contains the mail directory is relieved, message [EZD1863I](#) is displayed.

See [ExtendedRetry statement in z/OS Communications Server: IP Configuration Reference](#) for more information about the z/OS UNIX file system mail directory.

User response

Not applicable.

Problem determination

If you need to determine whether the target servers are having problems receiving the mail, see [gathering diagnostic information about CSSMTP problems in z/OS Communications Server: IP Diagnosis Guide](#) for setting up diagnostic traces.

```

EZD1901I	Remote security endpoint at <i>remote_ip</i> port <i>remote_port</i> is using an unsupported authentication method <i>auth_method_string</i> <i>auth_method</i>
-----------------	--

Explanation

The authentication method that is identified in the authentication payload that was sent by the remote security endpoint is not supported. The Internet Key Exchange (IKE) daemon cannot authenticate the remote security endpoint.

In the message text:

remote_ip

The remote security endpoint IP specification.

remote_port

The remote port of the IKE daemon peer.

auth_method_string

The string that identifies the authentication method being used by the peer.

auth_method

The decimal value that represents the authentication method that is used by the peer.

System action

The IKE SA negotiation fails; IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Notify the administrator of the remote security endpoint that it is using an unsupported authentication method.

User response

Not applicable.

Problem determination

None.

7

Automation

This message is output to syslog.

Example

```
EZD1901I Remote security endpoint at 1.2.3.4 port 500 is using an unsupported authentication  
method DSS_Digital_Signature 3
```

EZD1902I	Delayed rekey attempt for IKE tunnel <i>tunnel_id</i>; proceeding with incomplete exchanges: <i>half_open_count</i> half-open, <i>half_closed_count</i> half-closed, <i>rekey_requested_count</i> rekeying
-----------------	---

Explanation

The Internet Key Exchange (IKE) daemon delayed a rekey attempt for the specified IKE tunnel to allow exchanges for one or more of its child Security Associations (SAs) to complete. The limit for the length of the delay was reached, so the rekey attempt has been initiated.

In the message text:

tunnel_id

The tunnel prefix and number that were used to identify the tunnel.

half_open_count

The count of child SAs that are in HALF_OPEN state at the time that the IKE SA rekey attempt was initiated.

half_closed_count

The count of child SAs that are in HALF_CLOSED state at the time that the IKE SA rekey attempt was initiated.

rekey_requested_count

The count of child SAs that are in the process of being rekeyed at the time that the IKE SA rekey attempt was initiated.

System action

IKE daemon processing continues

Operator response

```
EZD1902I Delayed rekey attempt for IKE tunnel K21; proceeding with incomplete exchanges: 0 half-  
open,          1 half-closed, 0 rekeying
```

EZD1903I	<i>A request_type request message sent to the NSS server with correlator ID corr_id timed out</i>
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon did not receive a timely response from the network security services (NSS) server for the corresponding request.

In the message text:

request_type

The type of request to the NSS server that timed out.

corr_id

The 16-byte message correlator contained in the request message.

System action

The IKE SA negotiation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Verify that the NSS server is operational, and that the network that connects it to the IKE daemon is not congested.

User response

Not applicable.

Problem determination

None.

7

Automation

This message is output to syslog.

Example

EZD1903I A NSS_CreateSignatureReqToSrv request message sent to the NSS server with correlator ID 0000000000000000060000000000000000 timed out	
EZD1904E	IKED NSS client API version <i>clientAPIversion</i> does not match NSS server API version <i>serverAPIversion</i> for stack <i>stackname</i>

Explanation

The Internet Key Exchange daemon (IKED) connected to a Network Security Services (NSS) server that was supporting a lower level of the NSS API. Certificate services such as Certificate Revocation List (CRL) checking, Certificate Authority (CA) Hierarchy validation, and HTTP certificate retrieval are not available for this stack. The lack of this support limits the kinds of tunnels that the IKE daemon can negotiate for the stack. The IKE daemon is able to negotiate IKEv1 and IKEv2 tunnels using preshared key authentication for the stack. The IKE daemon is able to negotiate IKEv1 tunnels with digital signature authentication but without support for CRL checking or CA Hierarchy validation for the stack. The IKE daemon is unable to negotiate IKEv2 tunnels with digital signature authentication for the stack.

In the message text:

- clientAPIversion***
The version of the NSS client API supported by the IKE daemon.
- serverAPIversion***
The version of the NSS server API supported by the NSS server.
- stackname***
The name of the stack that connected to the NSS server supporting a lower level of the NSS API.

System action

IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Connect the IKE daemon NSS client to an NSS server that is running on a z/OS Communications Server V1R12 or greater system. To identify the NSS server that the IKE daemon is currently connected to, inspect the system log for EZD1136I.

User response

Not applicable.

Problem determination

Not applicable.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

stackobj.cpp

Routing code

3

Descriptor code

3

Automation

This message goes to the console and to syslog.

Example

```
EZD1904E IKED NSS client API version 4 does not match NSS server API version 1 for stack TCPCS
```

EZD1905I	IKE version <i>version</i> tunnel activation for <i>stackname</i> using KeyExchangeRule <i>kername</i> requires the NSS certificate service but the service is not available - return code = <i>retcode</i>
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon is unable to activate an IKE tunnel because the required NSS certificate service is not available.

In the message text:

version

The version of the IKE protocol being used to activate the tunnel.

stackname

The name of the TCP/IP stack for which the IKE tunnel is being activated.

kername

The name of the KeyExchangeRule being used for this IKE tunnel activation attempt.

retcode

The reason why the required certificate service is unavailable. Possible values are:

- 1**
The stack is not configured as an NSS client.
- 2**
The stack is configured as an NSS client but is not configured for the certificate service.
- 3**
The stack is connected to an NSS server but the stack is not authorized to use the certificate service.
- 4**
The stack is connected to an NSS server that does not support advanced PKI certificate services.

The NSS certificate service is required for all IKEv2 tunnel activation requests that use an authentication method other than PresharedKey. For example, if the KeyExchangeAction statement for the specified KeyExchangeRule has HowToInitiate IKEv2 and HowToAuthMe RSASignature, the NSS certificate service is required to activate the IKE tunnel.

System action

This tunnel activation attempt fails. IKE daemon processing continues.

Operator response

None.

System programmer response

The appropriate corrective action depends on the *retcode* value in the message:

- 1**
Configure the stack as an NSS client that requests NSS certificate services.
- 2**
Configure the stack as an NSS client that requests NSS certificate services.
- 3**
Notify the system programmer of the NSS server to provide authorization to the stack for network security certificate services.
- 4**
Change the configuration of the IKE daemon to connect to an NSS server that does support advanced PKI certificate services; for example, an NSS server on a z/OS V1R12 system.

See the information about [IP security in z/OS Communications Server: IP Configuration Guide](#) for information about network security certificate services.

```

EZD1908I	Tunnel activation for <i>stackname</i> using KeyExchangeRule <i>kername</i> failed because the identity type is not compatible with the authentication method
-----------------	--

Explanation

An attempt to initiate Internet Key Exchange version 2 (IKEv2) tunnel activation for a stack failed because the LocalSecurityEndpoint statement that is defined for the KeyExchangeRule statement has Identity type KeyId, but the KeyExchangeAction statement specifies a local authentication method on the HowToAuthMe parameter that is not pre-shared key. Identity type KeyId can be used only in conjunction with PresharedKey authentication.

In the message text:

stackname

The name of the stack for which the IKE tunnel is being activated

kername

The name of the KeyExchangeRule for this IKE tunnel activation attempt.

System action

This tunnel activation attempt fails. IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Find the named KeyExchangeRule in the IPSec policy definitions and change the HowToAuthMe value to PresharedKey, or change the LocalSecurityEndpoint Identity to a type that is compatible with the authentication method specified on HowToAuthMe value (for example, Fqdn).

User response

Not applicable.

Problem determination

Not applicable.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

anchor_ureq.cpp

Routing code

7

Descriptor code

11

Automation

The message is output to syslog

Example

```
EZD1908I Tunnel activation for TCPCS2 using KeyExchangeRule IKEv2-SA1-TCP failed because the identity  
type          is not compatible with the authentication method
```

EZD1909I	IP validation failed: the remote identity <i>peer_id</i> does not match remote IP address <i>peer_ip_addr</i>
-----------------	--

Explanation

Local policy required that the IP type identity of the internet key exchange (IKE) peer be validated by comparing it to the IP address of the IKE peer. The IP validation failed because the remote identity received from the IKE peer does not match the IP address of the IKE peer.

Additional diagnostic messages with the same message instance number will be issued to identify the impacted Security Association (SA). The message instance number precedes the message number in the log output and is used to group related messages from the IKE daemon.

In the message text:

peer_id

The identity of the IKE peer.

peer_ip_addr

The IP address of the IKE peer.

System action

The SA negotiation fails. IKE daemon processing continues.

Operator response

Contact the system programmer

System programmer response

Locate the KeyExchangeRule statement in the IP Security (IPSec) policy definitions associated with the impacted SA. Set the BypassIPValidation parameter to yes in the associated KeyExchangeAction statement to avoid the IP validation check or change the associated RemoteSecurityEndpoint Identity parameter to include the remote peer IP address. The IP validation check can be overridden globally by using the ByPassIPValidation parameter on the KeyExchangePolicy statement in the IPSec policy. The BypassIPValidation parameter should be set to yes if the RemoteSecurityEndpoint peer is behind a network address translation (NAT) device.

See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

EZD1909I  IP validation failed: the remote identity 2001:db8:10::83:2:2  does  not match
          remote IP address 2001:db8:10::84:2:2
```

EZD1910I **FIPS140 support is enabled for the IKE daemon and no valid KeyExchangeOffers were found in KeyExchangeAction (KEAname)**

Explanation

This message is issued when the IKE daemon is enabled to support the Level 1 security requirements of Federal Information Processing Standard publication 140-2 (FIPS 140), and one or more KeyExchangeOffer objects were omitted from the specified KeyExchangeAction object. If the IKE daemon is enabled for FIPS 140, the daemon omits KeyExchangeOffer objects that use the DES, MD5, or AES_XCBC cryptographic algorithms, or Diffie-Hellman groups 1, 2, or 5 from any proposal it builds.

In the message text:

KEAname
The KeyExchangeAction name that is configured in the policy.

System action

The SA negotiation fails; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

If you want the IKE daemon to be enabled to support FIPS 140, ensure that at least one KeyExchangeOffer object exists in the specified KeyExchangeAction object that does not contain any of the following:

- HowToEncrypt DES
- HowToAuthMsgs MD5
- HowToVerifyMsgs HMAC_MD5_96
- HowToVerifyMsgs AES128_XCBC_96
- PseudoRandomFunction HMAC_MD5
- PseudoRandomFunction AES128_XCBC
- DHGroup Group1, Group2, Group5

If you do not want to continue to have the IKE daemon enabled to support FIPS 140, then configure FIPS140 No on the IkeConfig statement in the IKED configuration file and restart the IKE daemon.

See the information about Policy Agent and policy applications in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

EZD1911I	FIPS140 support is enabled for the IKE daemon and no valid IpDataOffers were found in IpDynVpnAction (IDVAname)

Explanation

This message is issued when the IKE daemon is enabled to support the Level 1 security requirements of Federal Information Processing Standard publication 140-2 (FIPS 140), and one or more IpDataOffer objects were omitted from the specified IpDynVpnAction object. If the IKE daemon is enabled for FIPS 140, the daemon omits IpDataOffer objects that use the DES, MD5, or AES_XCBC cryptographic algorithms, or Pfs with Diffie-Hellman groups 1, 2, or 5 from any proposal it builds.

In the message text:

IDVAname

The IpDynVpnAction name that is configured in the policy.

System action

The SA negotiation fails; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

If you want the IKE daemon to be enabled to support FIPS 140, ensure that at least one IpDataOffer object exists in the specified IpDynVpnAction object that does not contain any of the following:

- HowToEncrypt DES
- HowToAuth Hmac_MD5
- HowToAuth AES128_XCBC_96
- Pfs Group1, Group2, or Group5 (specified in the IpDataOffer's associated IpDynVpnAction)
- InitiateWithPfs Group1, Group2, Group5 (specified in the IpDataOffer's associated IpDynVpnAction)
- AcceptablePfs Group1, Group2, Group5 (specified in the IpDataOffer's associated IpDynVpnAction)

If you do not want the IKE daemon to be enabled to support FIPS 140, then configure FIPS140 No on the IkeConfig statement in the IKED configuration file and restart the IKE daemon.

See the information about [Policy Agent and policy applications](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

```

EZD1912I	No SharedKey was specified in KeyExchangeRule (KERname) and KeyExchangeOffers in KeyExchangeAction (KEAname) require PresharedKey authentication
-----------------	---

Explanation

One or more of the KeyExchangeOffer objects that are available for use by the specified KeyExchangeRule object was configured to use PresharedKey to authenticate peers, but the KeyExchangeRule object did not specify a SharedKey to be used.

In the message text:

KERname

The KeyExchangeRule name that is configured in the policy.

KEAname

The KeyExchangeAction name that is configured in the policy.

System action

The SA negotiation fails; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

If you want to use a pre-shared key to authenticate peers during this SA negotiation, specify a pre-shared key on the SharedKey parameter in the associated KeyExchangeRule object. Otherwise, you can use a digital signature to authenticate peers by specifying a digital signature authentication method on the HowToAuthPeers parameter in one or more of the KeyExchangeOffer objects associated with this KeyExchangeRule object. ```

EZD1913I**ICSF callable service *routine* failed RC: *return_code* RSN: *reason_code***

Explanation

An Integrated Cryptographic Service Facility (ICSF) callable service that is required by the IKE daemon has failed.

In the message text:

routine

The ICSF callable service.

return_code

The failure code returned by ICSF.

reason_code

The failure reason code returned by ICSF.

System action

The IKE function that called the ICSF callable service fails; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

Examine the syslog for subsequent failures to determine the consequences. See the information about the [ICSF and cryptographic coprocessor return and reason codes in z/OS Cryptographic Services ICSF Application Programmer's Guide](#) to determine the reason for the failure and possible corrective actions.

User response

Not applicable.

Problem determination

Not applicable.

Source

z/OS Communications Server TCP/IP: IKE daemon

Module

dh_ecp_module.cpp

Routing code

Not applicable for syslog message.

Descriptor code

Not applicable for syslog message.

Automation

Not applicable.

Example

```
EZD1913I ICSF callable service CSFPGKP failed RC: 0000000C RSN: 00000000
```

Return Code (C) with Reason Code (0) indicates that ICSF is not available.

EZD1914I	Remote security endpoint at <i>remote_ip</i> port <i>remote_port</i> sent a signing certificate with encoding <i>encoding</i> that is not allowed
-----------------	--

Explanation

An IKE version 2.0 Security Association (SA) activation attempt failed because the remote security endpoint sent a signing certificate that contained encoding that is not allowed by locally defined IPsec policy. The signing certificate appears in the first certificate payload.

In the message text:

- remote_ip***
The remote security endpoint IP specification.
- remote_port***
The port of the remote security endpoint.
- encoding***
The encoding of the received signing certificate payload.

System action

The IKE SA negotiation fails; IKE daemon processing continues.

Operator response

None.

System programmer response

Notify the administrator of the remote security endpoint that it must not send certificate payloads that contain the disallowed encoding. Alternatively, the administrator of the z/OS security endpoint can change local IPsec policy to allow such certificate payload encodings.

See the information about [Policy Agent](#) and policy applications in [z/OS Communications Server: IP Configuration Reference](#) for information about the CertificateURLLookupPreference keyword of the KeyExchangePolicy or KeyExchangeAction statement.

User response

Not applicable.

Problem determination

None.

Automation

This message is output to syslog.

Example

```
EZD1914I Remote security endpoint at 1.2.3.4 port 500 sent a signing certificate with encoding 12
         that is not allowed
```

EZD1915I	Rekey attempt for IKE tunnel <i>tunnel_id</i> rejected because of incomplete exchanges: <i>half_open_count</i> half-open, <i>half_closed_count</i> half-closed, <i>rekey_requested_count</i> rekeying
-----------------	--

Explanation

The IKE daemon received a rekey request for the specified IKE tunnel from the IKE peer. The request is rejected to allow incomplete exchanges for one or more of the IKE tunnel's child Security Associations (SAs) to complete before replacing the IKE SA with a new IKE SA.

IKE rejects the rekey request by sending a NO_PROPOSAL_CHOSEN notification to the peer.

In the message text:

- tunnel_id***
The tunnel prefix and number used to identify the tunnel.
- half_open_count***
The count of child SAs that are in HALF_OPEN state.
- half_closed_count***
The count of child SAs that are in HALF_CLOSED state.
- rekey_requested_count***
The count of child SAs that are in the process of being rekeyed.

System action

The IKE tunnel rekey request fails. IKE daemon processing continues.

Operator response

```
EZD1915I Rekey attempt for IKE tunnel K21 rejected because of incomplete exchanges: 1 half-open,
        0 half-closed, 0 rekeying
```

EZD1916I	NSS server cryptographic services are disabled for stack <i>tcpname</i> - FIPS140 support is enabled for the IKE daemon but is not enabled for the NSS server
-----------------	--

Explanation

The Federal Information Processing Standard 140 (FIPS 140) function is enabled for the IKE daemon, but it is not enabled for the network security services (NSS) server. The NSS server is not permitted to provide cryptographic services to the IKE daemon for the stack.

In the message text:

tcpname

The name of the affected TCP/IP stack.

System action

IKED will not enable cryptographic services through the NSS server for the named stack. IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

When the IKE daemon is enabled for FIPS 140 support, stacks that are configured to use the NSS server for cryptographic services require that the NSS server also be enabled for FIPS 140 support.

The stack configuration, the IP security policy for the stack, the IKE daemon configuration, and the NSS server configuration must all be consistent. To understand the implications and requirements for enabling FIPS 140 support in your environment, see the information about [FIPS 140 and IP security in z/OS Communications Server: IP Configuration Guide](#).

User response

Example

```
EZD1916I NSS server cryptographic services are disabled for stack TCPCS - FIPS140 support is enabled  
for the IKE daemon but is not enabled for the NSS server.
```

EZD1917I

**IKE status for stack *tcpname* is FIPS140 enabled but IKED is not
FIPS140 enabled**

Explanation

The Federal Information Processing Standard 140 (FIPS 140) function is enabled for the named TCP/IP stack, but it is not enabled for the IKE daemon. The Internet Key Exchange (IKE) daemon is not permitted to provide cryptographic services to the stack.

In the message text:

tcpname

The name of the affected TCP/IP stack.

System action

The IKE daemon will not perform Security Association (SA) negotiation or any other cryptographic services for the specified stack. IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Stacks that are enabled for FIPS 140 support require that the IKE daemon also be enabled for FIPS 140 support.

The stack configuration, the IP security policy for the stack, the IKE daemon configuration, and the NSS server configuration must all be consistent. To understand the implications and requirements for enabling FIPS 140 support in your environment, see the information about [FIPS 140 and IP security in z/OS Communications Server: IP Configuration Guide](#).

7

Automation

This message is output to syslog.

Example

```
EZD1917I IKE status for stack TCPCS is FIPS140 enabled but IKED is not FIPS140 enabled.
```

EZD1918I

A cryptographic key in use is too short for the chosen Auth or PRF algorithm when FIPS140 is enabled: key length *keylen* bytes, minimum required *minlen* bytes

Explanation

When Federal Information Processing Standard publication 140 (FIPS 140) support is enabled for the IKE daemon, all of the cryptographic keys that are used by the chosen authentication (Auth) or pseudo random function (PRF) algorithm must be at least half the length of the PRF digest size. These cryptographic keys can be the configured pre-shared key that is used for IKE authentication, or, if you are using Internet Key Exchange version 2 (IKEv2), they can be the keys that are used by the IKE daemon to internally generate keying material for a prior IKE SA.

In the message text:

keylen

The length of the key.

minlen

The minimum key length that is required for the chosen Auth or PRF algorithm.

System action

IKED phase 1 tunnel negotiation fails. IKE daemon processing continues.

Operator response

Contact the system programmer.

System programmer response

Examine the surrounding IKED messages in the syslogd log file to determine which tunnel is affected. The following criteria apply when FIPS 140 support is enabled for the IKE daemon:

- If a pre-shared key is configured, it must be at least half as long as the key used by the configured Auth and PRF algorithms. If the pre-shared key is not that length, the IKED phase 1 tunnel negotiation fails, and message EZD1918I is issued. To prevent the negotiation from failing, modify the tunnel policy to configure a longer pre-shared key, or modify the tunnel policy to use an Auth or PRF algorithm with a shorter key. Policy changes must be coordinated across all endpoints that are involved in the tunnel negotiation.
- You should not modify the policy for an active IKEv2 tunnel to specify a PRF algorithm that uses a key that is more than twice the length of the originally specified PRF algorithm. You need to deactivate the IKE tunnel before you make such a modification; otherwise, a refresh of the active tunnel might fail and message EZD1918I will be issued. For example, if you switch from the HMAC_SHA1 algorithm to the HMAC_SHA2_256 algorithm, message EZD1918I will be issued during the tunnel refresh, but if you switch from the HMAC_SHA2_256 algorithm to the HMAC_SHA1 algorithm, the message will not be issued.

See [FIPS 140 and IP security in z/OS Communications Server: IP Configuration Guide](#) for information about FIPS 140 support in your environment.

```
EZD1918I A cryptographic key in use is too short for the chosen Auth or PRF algorithm when FIPS140 is
         enabled: key length 12 bytes, minimum required 16 bytes
```

EZD1919I

**FIPS140 support is enabled for the IKE daemon but it has read access
to CRYPTOZ resource FIPSEXEMPT.SYSTOK-SESSION-ONLY**

Explanation

When the IKE daemon is configured for Federal Information Processing Standard 140 (FIPS 140) mode, the IKE daemon must have no access privileges (NONE) to the SAF resource FIPSEXEMPT.SYSTOK-SESSION-ONLY in the CRYPTOZ class.

See the [IkeConfig statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about configuring FIPS 140.

System action

The IKE daemon ends.

Operator response

Contact the system programmer.

System programmer response

Remove IKE daemon access to the SAF resource, or disable FIPS 140 mode for the IKE daemon. See the [IkeConfig statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for about configuring FIPS 140.

User response

Not applicable.

Problem determination

None.

EZD1920I	Attempting an on-demand activation for IKE outbound UDP traffic from <i>source_ipaddr</i> port <i>source_port</i> to <i>dest_ipaddr</i> port <i>dest_port</i> using anchor filter <i>filtername</i>
-----------------	--

Explanation

The Internet Key Exchange (IKE) daemon is attempting to negotiate an on-demand IPsec Security Association to protect outbound traffic on UDP ports 500 or 4500. The IKE daemon might use either port 500 or port 4500 when it is negotiating Security Associations.

This is not an error condition, but it is a possible indication of a misconfiguration. Usually, IKE daemon UDP traffic is allowed without IPsec protection. If the IKE daemon must negotiate a Security Association to protect its own messages, then it is likely that the negotiation will fail. If the negotiation fails, the IKE daemon issues subsequent syslog messages to indicate that the Security Association negotiation failed.

See the [steps for configuring IP security policy](#) in [z/OS Communications Server: IP Configuration Guide](#) for information.

In the message text:

source_ipaddr

The source IP address.

source_port

The source port.

dest_ipaddr

The destination IP address.

dest_port

The destination port.

filtername

The name of matching anchor filter rule.

System action

The IKE daemon continues processing.

Operator response

None.

System programmer response

If FIPS 140 support is required and the certificate is required for the RSA mode authentication, re-key the certificate with an RSA key that has a key size of 1024 bits or greater. If FIPS 140 support is not required for the IKE daemon, stop the daemon, configure FIPS140 No in the IKE configuration file, and restart the daemon.

User response

```
EZD1921I Certificate ( Certificate512 ) contains a key that is too short for FIPS 140 mode
```

EZD1922I **IKE STATUS FOR STACK *stackname* IS ACTIVE WITHOUT PORTS**

Explanation

The IKE daemon detected that the specified stack is active, but it was not able to complete initialization of ports 500 and 4500. The IKE daemon cannot establish security associations for the specified stack, because port initialization did not succeed.

In the message text:

stackname

The name of the stack that is active without ports.

System action

The IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

Examine the syslogd output file for errors preceding message EZD1922I. The most likely cause is failing to bind UDP port 500 or UDP port 4500, because the port is in use by another application or reserved for another application. If so, check the PORT statement in the TCPIP profile for the specified stack. Ensure that UDP port 500 and UDP port 4500 are reserved for the IKE daemon. If some other internal errors occur, contact the IBM support center.

EZD1923I

A create signature request to the NSS server failed; no matching certificate was found for local security endpoint identity *local_id* and authentication method *auth_method*

Explanation

The IKE daemon made a network security certificate services request to create a digital signature. A certificate matching the local security endpoint identity and authentication method was not found on the network security services (NSS) server.

In the message text:

local_id

The local security endpoint identity.

auth_method

The authentication method.

System action

The request fails; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

If you want to use network security certificate services with the specified local security endpoint identity, add a matching certificate to the key ring of the NSS server. See the [Steps for configuring the NSS server in z/OS Communications Server: IP Configuration Guide](#) for more information.

```

EZD1924I

**IKE detected a NAT while initiating a new tunnel mode IKEv2 dynamic
tunnel with a non-z/OS peer**

Explanation

The Internet Key Exchange (IKE) daemon is initiating a tunnel-mode Security Association (SA) for a new IKEv2 dynamic tunnel with a non-z/OS peer. The SA traverses a Network Address Translation (NAT) device. There might be problems with interoperability with the non-z/OS peer for a tunnel-mode SA. z/OS is providing

NAT traversal support for a defined group of configurations where z/OS is running the IKE daemon. See the [IP security in z/OS Communications Server: IP Configuration Guide](#) for a description of the supported configurations and interoperability considerations.

System action

The SA negotiation continues.

Operator response

If the SA negotiation fails or if data cannot be successfully sent over the SA, contact the system programmer.

System programmer response

Determine whether there is an interoperability concern that caused the SA negotiation or data flow to fail. See the [IP security in z/OS Communications Server: IP Configuration Guide](#) for a description of the supported configurations and interoperability considerations.

If this is a host-to-host tunnel, a possible solution is to use a transport-mode IpDynVpnAction object instead of a tunnel-mode IpDynVpnAction object. See the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

```

EZD1925I

IKE detected a NAT while initiating a new transport mode IKEv2 dynamic tunnel with a non-z/OS peer

Explanation

The Internet Key Exchange (IKE) daemon is initiating a transport-mode Security Association (SA) for a new IKEv2 dynamic tunnel with a non-z/OS peer. The SA traverses a Network Address Translation (NAT) device. There might be problems with interoperability with the non-z/OS peer for a transport-mode SA. z/OS is providing NAT traversal support for a defined group of configurations where z/OS is running the IKE daemon. See the [IP security in z/OS Communications Server: IP Configuration Guide](#) for a description of the supported configurations and interoperability considerations.

System action

The SA negotiation continues.

Operator response

If the SA negotiation fails or if data cannot be successfully sent over the SA, contact the system programmer.

System programmer response

Determine whether there is an interoperability concern that caused the SA negotiation or data flow to fail. See the [IP security in z/OS Communications Server: IP Configuration Guide](#) for a description of the supported configurations and interoperability considerations. Confirm that the non-z/OS peer supports transport-mode with NAT traversal as defined in RFC 5996 section 2.23.1.

A possible solution is to use a tunnel-mode IpDynVpnAction object instead of a transport-mode IpDynVpnAction object. See the [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](#) for more information about configuring policy.

EZD1928I

***tcpstackname* WILL NOT JOIN THE SYSPLEX - GLOBALCONFIG
SYSPLEXMONITOR NOJOIN IS CONFIGURED**

Explanation

The TCP/IP stack will not join the sysplex group and will not process sysplex definitions within the profile (VIPADYNAMIC and IPCONFIG/IPCONFIG6 DYNAMICXCF statements).

In the message text:

tcpstackname

The name of the TCP/IP stack.

System action

TCP/IP continues.

Operator response

If you want the TCP/IP stack to immediately join the sysplex group, issue the `VARY TCPIP,,SYSPLEX,JOINGROUP` command. See the information about the [VARY TCPIP,,SYSPLEX](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for information about the command and the `JOINGROUP` parameter.

System programmer response

If you want the stack to join the sysplex group when the stack is started, stop the stack, remove `NOJOIN` from the `GLOBALCONFIG` statement in the TCP/IP profile and restart the stack.

EZD1930I **HOT STANDBY SERVER FOR *destipaddr* PORT *portnum* AT *tcpstackname* ON *mvname* IS INACTIVE - *reason***

Explanation

The Sysplex Distributor server is switching from the active server because of the reason specified.

In the message text:

destipaddr

The distributed DVIPA.

portnum

The distributed port.

tcpstackname

The name of the TCP/IP stack.

mvname

The name of the MVS system where the TCP/IP job is running.

reason

The cause of the switch. Possible values are:

THE TARGET SERVER IS NOT READY

The target server has a ready count of 0.

THE PATH TO THE TARGET SERVER IS INACTIVE

The datapath to the XCF target is inactive.

AUTOSWITCHBACK TO THE PREFERRED SERVER OCCURRED

The preferred server was previously either not ready, or the datapath was inactive and the sysplex distribution was switched to a backup server. The preferred server is now ready, or the datapath is active, so the sysplex distribution has switched back to the preferred server.

THE TSR IS 0%

The Target Server Responsiveness of the server is 0%.

THE ABNORMAL TERMINATION LIMIT OF 1000 HAS BEEN REACHED

The target server reported that out of 1000 transactions, all of them terminated abnormally.

THE SERVER HEALTH IS 0%

The target server reported a health of 0%.

System action

TCP/IP continues.

Operator response

Not applicable.

System programmer response

Fix the problem after analyzing the message. If the server is not ready, verify that the target server is in LISTEN state. If you cannot fix the problem, then contact your IBM support center with the TCP/IP profile, system log and a dump.

Example

```
EZD1946I Option -i is missing required data
```

EZD1947I Unexpected characters found on line *line_number* - *characters*

Explanation

The **certbundle** command encountered unexpected characters while parsing the options file.

In the message text:

line_number

The line number in the options file on which the unexpected characters were found.

characters

The unexpected characters that were found in the options file

System action

The **certbundle** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Correct the options file syntax and reissue the command. See the information about the [certbundle](#) command in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man certbundle** command in a z/OS UNIX shell to obtain information about the **certbundle** command syntax and options.

Example

```
EZD1947I Unexpected characters found on line 5 - Comment
```

EZD1948I	Could not open <i>file_type</i> (<i>file_name</i>) - <i>description</i>
-----------------	--

Explanation

The **certbundle** command was unable to open the specified file.

In the message text:

file_type

The type of file that the command failed to open. Some options are the CertBundleOptions, CRLFile, or BundleFile.

file_name

The name of the file that the command failed to open.

description

A description of the system error encountered by the command.

System action

The **certbundle** command processing ends.

Operator response

Ensure that the file name exists at the specified location and that the **certbundle** command has permission to read the file.

```
EZD1948I Could not open CertBundleOptions ( /tmp/options_file ) - EDC5113I Bad file descriptor.
```

EZD1949I	CertBundleOptions statement beginning on line <i>line_number</i> references a self-signed certificate (<i>label</i>)
-----------------	---

Explanation

The **certbundle** command parsed a CertBundleOptions statement that references a self-signed certificate. Self-signed certificates do not need to be placed in a certificate bundle.

In the message text:

line_number

The line number in the options file where the CertBundleOptions statement begins.

label

The certificate label of the self-signed certificate that was referenced.

System action

The self-signed certificate will be included in the bundle and **certbundle** command processing continues.

Operator response

Contact the system programmer.

System programmer response

Determine if the self-signed certificate is required in the certificate bundle. If it is not required, remove the CertificateLabel or CertificateChain parameter that references the self-signed certificate and reissue the command.

EZD1952I	<i>keyword on line <u>line_number</u> is not a recognized parameter or statement</i>
-----------------	---

Explanation

The **certbundle** command encountered an unrecognized parameter or statement while parsing the options file.

In the message text:

keyword
The unrecognized parameter or statement.

line_number
The line number in the options file that contains the unrecognized keyword.

System action

The **certbundle** command processing ends.

Operator response

Correct the options file syntax and reissue the command. See the information about the **certbundle** command in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **certbundle** command in a z/OS UNIX shell to obtain information about the certbundle options file syntax.

```

EZD1953I **Incorrect *opt* option value *value* is ignored**

Explanation

An incorrect option value was specified and ignored.

In the message text:

opt

The **certbundle** command option that was specified.

value

The value that was specified for the **certbundle** command option.

System action

The **certbundle** command continues, using any specified valid values or any default values.

Operator response

Specify an option value that is in the accepted value range and issue the **certbundle** command again. See the information about the [certbundle command](#) in *z/OS Communications Server: IP System Administrator's Commands* or issue the **man certbundle** command in a z/OS UNIX shell to obtain information about the **certbundle** command syntax and options.

certificate ( FVT Root1 CA ) in the bundle
```

EZD1955I	CertBundleOptions statement beginning on line <i>line_number</i> is missing <i>keyword</i> parameter
-----------------	---

Explanation

The **certbundle** command found that a parameter was missing from a CertBundleOptions statement in the options file.

In the message text:

line_number

The line number in the options file where the CertBundleOptions statement begins.

keyword

The missing parameter.

System action

The **certbundle** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Correct the options file syntax and reissue the command. See the information about the `certbundle` command in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **certbundle** command in a z/OS UNIX shell to obtain information about the certbundle options file syntax.

```

EZD1957I *type brace (**brace**) expected, but not found*

Explanation

The `certbundle` command encountered an error while parsing the options file. A brace was expected but not found.

In the message text:

type

The type of brace that was expected. Opening braces (`{`) and closing braces (`}`) are expected throughout the options file.

brace

The literal character that was expected within the options file.

System action

The **certbundle** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Correct the options file syntax and reissue the command. See the information about the **certbundle** command in *z/OS Communications Server: IP System Administrator's Commands* or issue the **man certbundle** command in a z/OS UNIX shell to obtain information about the **certbundle** options file syntax.

EZD1964I	Error creating bundle file (<i>file_name</i>) - <i>description</i>
-----------------	---

Explanation

The **certbundle** command encountered an error while it was creating the bundle file.

In the message text:

file_name

The name of the bundle file that the **certbundle** command failed to create.

description

A description of the system error that caused the failure.

System action

The **certbundle** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Ensure that the path name of the bundle file is specified correctly, that the path exists, that the file system is mounted in read/write mode, and that the user ID under which the command is running has permission to write to the file system. Then reissue the command.

User response

Not applicable.

```

EZD1965I	CertBundleOptions statement beginning on line <i>line_number</i> does not support both CertificateLabel and CertificateChain parameters
----------	---

Explanation

The **certbundle** command encountered an error while it was parsing the options file. A CertBundleOptions statement was found that contains both CertificateLabel and CertificateChain parameters. A single CertBundleOptions statement can support only one of these parameters.

In the message text:

line number

The line number on which the CertBundleOptions statement started.

System action

The **certbundle** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Correct the options file syntax and reissue the command. See the information about the `certbundle` command in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the `man certbundle` command in a z/OS UNIX shell to obtain information about the `certbundle` options file syntax.

Example

```
EZD1965I CertBundleOptions statement beginning on line 6 does not support both CertificateLabel and
CertificateChain parameters
```

EZD1966I *parameter parameter unexpected on line new_line because the parameter is already set to value on line old_line*

Explanation

The `certbundle` command found more than one definition for the specified parameter while parsing the options file. This parameter can be defined only once.

In the message text:

parameter

The parameter that was previously defined.

value

The value to which the parameter was previously defined.

old_line

The line on which the parameter was originally defined.

new_line

The line on which the parameter value was provided in error.

System action

The **certbundle** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Correct the options file syntax and reissue the command. See the information about the [certbundle command](#) in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man certbundle** command in a z/OS UNIX shell to obtain information about the certbundle options file syntax.

Example

```
EZD1966I KeyRing parameter unexpected on line 8 because the parameter is  already set to NSSD/  
RCSECPKI  
      on line 7
```

EZD1967I

Unbalanced or extra quote found on line *line_number*

Explanation

The **certbundle** command encountered an error as the result of incorrectly placed quotation marks while it was parsing the options file. If a parameter contains a value that itself contains double quotation marks, that value must be enclosed in two sets of double quotation marks, and the entire parameter must be enclosed in another set of double quotation marks. Only one value in a parameter value can contain quotation marks.

Examples:

Value that you enter	Value that is interpreted	Explanation
"EndEntity" "Bob" "Cert" "EndEntityBob" "Cert" ""	EndEntity"Bob"Cert EndEntityBob"Cert"	The value "Bob" includes double quotation marks The value "Cert" includes double quotation marks

System action

The **certbundle** command processing ends.

Operator response

Contact the system programmer.

System programmer response

Correct the options file syntax and reissue the command. See the information about the **certbundle** command in [z/OS Communications Server: IP System Administrator's Commands](#) or issue the **man certbundle** command in a z/OS UNIX shell to obtain information about the **certbundle** options file syntax.

```

EZD1968I CertBundleOptions statement beginning on line *line_number* references a self-signed certificate (*label*) but contains no CRLFile statement - bundle creation might be unnecessary

Explanation

The **certbundle** command parsed a CertBundleOptions statement that referenced a self-signed certificate. The same CertBundleOptions statement did not contain a CRLFile statement. The self-signed certificate will be added to the certificate bundle but the creation of a bundle file might be unnecessary.

In the message text:

line_number

The line number in the options file on which the CertBundleOptions statement begins.

label

The certificate label of the self-signed certificate that was referenced.

System action

The **certbundle** command processing continues.

Operator response

Contact the system programmer.

System programmer response

Determine if the self-signed certificate is required in the certificate bundle. If it is not required, remove the CertificateLabel or CertificateChain parameter that references the self-signed certificate and reissue the command.

User response

EZD1973E

**MULTIPLE *tcpstackname* NONRECOVERABLE ERRORS ARE ADVERSELY
AFFECTING SYSPLEX PROCESSING**

Explanation

Five TCP/IP abends occurred within one minute.

In the message text:

tcpstackname

The name of the TCP/IP stack.

System action

TCP/IP continues.

- If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions occur:
 - This stack leaves the TCP/IP sysplex group.
 - This stack no longer participates in sysplex distribution (as a distributor or target) or acts as an owner or a backup for DVIPAs. All DVIPAs defined on this stack are deactivated; however, the DVIPA definitions are saved.
 - When the stack leaves the TCP/IP sysplex group, this operator message is deleted.
- If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action is taken.

See the information about [sysplex problem detection and recovery](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

See the [GLOBALCONFIG statement configuration statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for more information about the SYSPLEXMONITOR parameters.

Operator response

Save the documentation that was taken when the problem occurred and contact the system programmer.

If the NORECOVERY option is active, no further actions are needed.

If the RECOVERY option is active, then even if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will not automatically rejoin the TCP/IP sysplex group. Message EZZ9676E will be displayed if the TCP/IP stack successfully deactivates all DVIPAs and leaves the TCP/IP sysplex group. After message EZZ9676E is displayed, issue the VARY TCPIP,,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed and to cause the stack to rejoin the TCP/IP sysplex group.

System programmer response

Contact IBM software support services with the TCP/IP profile, system log, and dump.

User response

z/OS Communications Server TCP/IP

Module

EZBXFPDC

Routing code

2,8

Descriptor code

2

Automation

Not applicable.

Example

MULTIPLE TCPCS NONRECOVERABLE ERRORS ARE ADVERSELY AFFECTING SYSPLEX PROCESSING	
EZD1974E	<i>tcpstackname</i> CSM HAS BEEN CONSTRAINED FOR AT LEAST <i>timevalue</i> SECONDS

Explanation

Sysplex problem detection determined that storage managed by the communications storage manager (CSM) has been constrained for multiple monitoring intervals.

In the message text:

tcpstackname
The name of the TCP/IP stack.

timevalue
The number of seconds that sysplex problem detection has determined that CSM has been constrained.

System action

TCP/IP continues.

If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active, and this stack is not the only member of the TCP/IP sysplex group, the following RECOVERY actions will occur:

- This stack will leave the sysplex group.
- This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack will be deactivated; however, the DVIPA definitions will be saved.

- If the problem is corrected, this operator message will be deleted. If the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will process the DVIPA definitions and rejoin the TCP/IP sysplex group.

If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action will be taken. Monitoring will continue. This operator message will be deleted when the CSM constraint is corrected.

See [sysplex problem detection and recovery](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

Operator response

Save the TCP/IP profile and system log. If a dump was not created, take a dump of the TCP/IP address space and dataspace, and the CSM dataspace.

System programmer response

Messages were issued before this message to report that CSM storage is constrained. Those messages identify the type of CSM storage that is constrained. See the documentation for those messages for the actions that you must take to resolve the storage constraint.

If the CSM storage problem cannot be corrected, contact your IBM support center with the documentation that was obtained when the problem occurred.

If the CSM storage problem can be corrected:

- If RECOVERY is being used, enable the stack to rejoin the sysplex group. Message EZZ9676E is issued after the process of leaving the sysplex group has successfully completed. After this message is issued, reapply the sysplex profile definitions by issuing VARY OBEY. This will cause the stack to rejoin the sysplex group.
- If NORECOVERY is being used, no further actions are needed.

UNABLE TO CLAIM A LIST IN THE *structure_name* STRUCTURE

Explanation

An attempt to claim a list in the identified EZBDVIPA coupling facility structure failed because a list was not available.

In a sysplex, an EZBDVIPA coupling facility structure is required to support Sysplex-wide Security Associations (SWSA). Tunnel sequence numbers are stored in the EZBDVIPA structure to enable sysplex distribution. Tunnel data is stored in the EZBDVIPA structure to enable DVIPA takeover.

Depending on the number of DVIPAs and IPsec tunnels in use, TCP/IP can exhaust the number of lists defined in the EZBDVIPA structure. Once all lists have been claimed, subsequent attempts to claim a list fail causing data traffic over the affected tunnel to fail if the traffic is distributed. Also, the affected tunnel cannot be recovered after a DVIPA takeover.

In the message text

structure_name

The name of the EZBDVIPA coupling facility structure for which the claim list failed.

Guideline: If subplexing is not in use, the name of the structure is EZBDVIPA. If you use subplexing within your sysplex, the name is in the form EZBDVIPA vv tt, where vv is the VTAM group ID and tt is the TCP/IP group ID.

The message stays on the console until new tunnels are successfully added to the structure.

System action

TCP/IP continues. Data traffic over the affected tunnel fails if the traffic is distributed. The affected tunnel can not be recovered after a DVIPA takeover.

Operator response

Contact the system programmer.

System programmer response

Issue D NET,STATS,TYPE=VTAM,STRNAME=*structure_name* on each VTAM in the sysplex to determine the number of lists in the coupling facility structure.

If message IST1189I appears in the DISPLAY STATS output, this indicates that VTAM might not have access to all the lists. For additional information on the DISPLAY STATS output, see the description of IST1189I under the first message in the display, IST1370I. See [Modifying the number of lists in z/OS Communications Server: SNA Network Implementation Guide](#) for instructions on how to adjust the number of lists that VTAM can access in the EZBDVIPA structure.

If your configuration has a large number of DVIPAs and you expect a large number of tunnels between endpoints, see [Modifying the number of lists in z/OS Communications Server: SNA Network Implementation Guide](#) for instructions on how to increase the number of lists for the EZBDVIPA structure.

Otherwise, evaluate your policy definitions to identify the reason for the unexpectedly large number of tunnels.

EZD1975E UNABLE TO CLAIM A LIST IN THE EZBDVIPA0122 STRUCTURE
```

EZD1976E

***tcpstackname* DELAYING SYSPLEX PROFILE PROCESSING - IPSEC
INFRASTRUCTURE IS NOT ACTIVE**

Explanation

The TCP/IP stack has delayed joining the sysplex group and delayed processing sysplex definitions within the profile (VIPADYNAMIC and IPCONFIG/IPCONFIG6 DYNAMICXCF statements) because the IPsec infrastructure is not active.

In the message text:

tcpstackname

The name of the TCP/IP stack

See [sysplex problem detection and recovery in z/OS Communications Server: IP Configuration Guide](#) for more information.

System action

TCP/IP continues.

Operator response

The IPsec infrastructure monitored by sysplex problem detection and recovery (SPDR) includes the Policy Agent, the Internet Key Exchange (IKE) daemon, and the Network Security Server (NSS) daemon (if configured). Verify that the Policy Agent, IKED, and optionally NSSD are active. If they are active and the message EZD1976E remains, contact the System Programmer.

This message is only issued if GLOBALCONFIG SYSPLEXMONITOR DELAYJOINIPSEC was specified in the TCP/IP profile. If you want the TCP/IP stack to immediately join the sysplex group rather than wait for the IPsec infrastructure activation to complete, issue the VARY TCPIP,,OBEYFILE command with GLOBALCONFIG SYSPLEXMONITOR NODELAYJOINIPSEC specified. For more information about the DELAYJOINIPSEC keyword, see the DELAYJOINIPSEC parameter description in [GLOBALCONFIG statement of z/OS Communications Server: IP Configuration Reference](#).

When the IPsec infrastructure activation is complete or a VARY TCPIP,,OBEYFILE command with GLOBALCONFIG SYSPLEXMONITOR NODELAYJOINIPSEC has been specified, TCP/IP joins the sysplex group and finishes processing the sysplex definitions.

System programmer response

Review the IKED syslogd messages to determine what conditions are preventing the TCP/IP stack from joining the sysplex.

For more information about the conditions being monitored, see [Sysplex autonomies for IPsec in z/OS Communications Server: IP Configuration Guide](#).

User response

Example

EZD1976E TCPCS DELAYING SYSPLEX PROFILE PROCESSING - IPSEC INFRASTRUCTURE IS NOT ACTIVE	
EZD1977E	<i>tcpstackname</i> HAS DETERMINED THAT THE IPSEC INFRASTRUCTURE WAS NOT RESPONSIVE FOR AT LEAST <i>timersecs</i> SECONDS

Explanation

Sysplex problem detection and recovery (SPDR) has determined that the IPsec infrastructure was not responsive for *timersecs* amount of time.

In the message text:

tcpstackname
The name of the TCP/IP stack

timersecs
The length of time, in seconds, that the IPsec infrastructure was not responsive. This value is defined by the GLOBALCONFIG SYSPLEXMONITOR TIMERSECS parameter in the TCP/IP profile. For more information

about the `TIMERSECS` parameter and how it is used to detect IPsec infrastructure problems, see [z/OS Communications Server: IP Configuration Guide](#) and [z/OS Communications Server: IP Configuration Reference](#).

See [sysplex problem detection and recovery](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

System action

TCP/IP continues.

- If the `GLOBALCONFIG SYSPLEXMONITOR RECOVERY` option is active and *tcpstackname* is not the only member of its sysplex group, the following RECOVERY actions occurs:
 - *tcpstackname* leaves the sysplex group.
 - *tcpstackname* no longer participates in sysplex distribution (as a distributor or target) or acts as an owner or a backup for DVIPAs. All DVIPAs defined on *tcpstackname* are deactivated; however, the DVIPA definitions are saved.
 - If the problem is corrected, this operator message is deleted; if the `GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN` option is active, *tcpstackname* processes the DVIPA definitions and rejoins the sysplex group.
- If the `GLOBALCONFIG SYSPLEXMONITOR NORECOVERY` option is active, no action is taken. If the problem is corrected, this operator message is deleted.

See [sysplex problem detection and recovery](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

See [GLOBALCONFIG statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for the definition of the `SYSPLEXMONITOR` parameters.

Operator response

The IPsec infrastructure monitored by sysplex problem detection and recovery (SPDR) includes the Policy Agent, the Internet Key Exchange (IKE) daemon, and the Network Security Server (NSS) daemon (if configured). If any of these infrastructure components are not active, activate them.

When the IPsec infrastructure becomes active and operational, this operator message is deleted. The following actions should be taken when the message is deleted:

- If `RECOVERY` and `NOAUTOREJOIN` are active, then issue the `VARY TCPIP,,SYSPLEX,JOINGROUP` command to cause the DVIPA definitions to be processed, and *tcpstackname* to rejoin the sysplex group.
- If `RECOVERY` and `AUTOREJOIN` are active, no further actions are needed. *tcpstackname* processes the DVIPA definitions and rejoin the sysplex group.
- If `NORECOVERY` is active, no further actions are needed.

If the infrastructure components cannot be activated or the components are active and the message `EZD1977E` remains, contact the System Programmer.

System programmer response

Review the IKED syslogd messages to determine what conditions caused this message to be issued

For more information about the conditions being monitored, see [Sysplex autonomics for IPsec](#) in [z/OS Communications Server: IP Configuration Guide](#).

***ip_addr* IGNORED BECAUSE IT IS ALREADY DEFINED AS AN
SMCRIPADDR IP ADDRESS**

Explanation

The IP address *ip_addr* specified in a VIPADYNAMIC VIPADEFINE or VIPADYNAMIC VIPABACKUP list is already defined as an SMCRIPADDR on this stack. The address is ignored (rejected from the VIPADEFINE or VIPABACKUP list in which it was defined), but other addresses in the VIPADEFINE or VIPABACKUP list are processed.

In the message text:

ip_addr

The IP address of the dynamic VIPA specified in the VIPADEFINE or VIPABACKUP list.

System action

TCPIP Profile processing continues. The specified dynamic VIPA address is not defined.

Operator response

Contact the system programmer.

System programmer response

If the IP address was incorrectly specified, correct the error and try the command or activation again.

For more information about configuring dynamic VIPAs, see: [VIPADYNAMIC - VIPADEFINE statement in z/OS Communications Server: IP Configuration Reference](#) and [VIPADYNAMIC - VIPABACKUP statement in z/OS Communications Server: IP Configuration Reference](#)

For information about configuring SMCRIPADDR on the INTERFACE statement, see [INTERFACE - IPAQENET OSA-Express QDIO interfaces statement in z/OS Communications Server: IP Configuration Reference](#) and [INTERFACE - EQNET Network Express Enhanced QDIO interfaces statement in z/OS Communications Server: IP Configuration Reference](#)

```

EZD1979E

***tcpstackname* HAS DETERMINED THAT THE DEFAULT IPSEC FILTERS
HAVE BEEN IN EFFECT FOR AT LEAST *timersecs* SECONDS**

Explanation

Sysplex problem detection and recovery (SPDR) has determined that the IPsec default filter rules have been in effect for at least *timersecs* amount of time. The IPsec infrastructure relies on IPsec policy filter rules being in effect.

In the message text:

tcpstackname

The name of the TCP/IP stack

timersecs

The length of time, in seconds, that the IPsec default filters have been in effect. This value is defined by the GLOBALCONFIG SYSPLEXMONITOR TIMERSECS parameter in the TCP/IP profile. For more information about the TIMERSECS parameter, see [z/OS Communications Server: IP Configuration Guide](#) and [z/OS Communications Server: IP Configuration Reference](#).

See [sysplex problem detection and recovery](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information.

System action

TCP/IP continues.

- If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and *tcpstackname* is not the only member of its sysplex group, the following RECOVERY actions occurs:

- *tcpstackname* leaves the sysplex group.
- *tcpstackname* no longer participates in sysplex distribution (as a distributor or target) or acts as an owner or a backup for DVIPAs. All DVIPAs defined on *tcpstackname* are deactivated; however, the DVIPA definitions are saved.
- If the problem is corrected, this operator message is deleted; if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, *tcpstackname* processes the DVIPA definitions and rejoins the sysplex group.
- If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action is taken. If the problem is corrected, this operator message is deleted.

See [sysplex problem detection and recovery in z/OS Communications Server: IP Configuration Guide](#) for more information.

See GLOBALCONFIG statement in [z/OS Communications Server: IP Configuration Reference](#) for the definition of the SYSPLEXMONITOR parameters.

Operator response

The IPsec filter rules are monitored by sysplex problem detection and recovery (SPDR). The IP filter rules have reverted to the default IP filter rule set.

This could be a result of a change to the TCP/IP policy to remove the IPsec policy. Use the z/OS UNIX ipsec command to determine if policy filter rules are installed.

```
ipsec -f display -c policy -p tcpstackname
```

If no policy filter rules are installed, contact the System Programmer.

If policy filter rules are installed, confirm that the current IPsec filter rule set is the default rule set. Use the z/OS UNIX ipsec command as follows:

```
ipsec -f display -c current -p tcpstackname
```

If the output shows "Source: Stack Profile", the default filter rules are in effect. Use the z/OS UNIX ipsec command to make the policy filters the current rule set.

```
ipsec -f reload -p tcpstackname
```

And confirm with:

```
ipsec -f display -c current -p tcpstackname
```

When the IPsec policy filter rules are in effect, this operator message is deleted. The following actions should be taken when the message is deleted:

- If RECOVERY and NOAUTOREJOIN are active, then issue the VARY TCPIP,,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed, and *tcpstackname* to rejoin the sysplex group.
- If RECOVERY and AUTOREJOIN are active, no further actions are needed. *tcpstackname* processes the DVIPA definitions and rejoins the sysplex group.
- If NORECOVERY is active, no further actions are needed.

If the message EZD1979E remains, contact the System Programmer.

System programmer response

If no IPsec policy is configured for this *tcpstackname*, the DELAYJOINIPSEC parameter should not be configured for the GLOBALCONFIG SYSPLEXMONITOR statement. As appropriate, either configure an IPsec policy for this *tcpstackname* or remove the DELAYJOINIPSEC parameter from the GLOBALCONFIG SYSPLEXMONITOR statement.

**Real-time application-controlled TCP/IP trace NMI has been disabled –
reason code *rsncode***

Explanation

The real-time application-controlled TCP/IP trace network management interface (NMI) has been disabled because of an error. The *rsncode* value provides the reason for the error. See [Real-time application-controlled TCP/IP trace NMI](#) in [z/OS Communications Server: IP Programmer's Guide and Reference](#) for more information about this NMI.

In the message text:

rsncode

A code that explains the error. Possible values are:

- 1**
Unable to obtain the TCP/IP address space private storage for internal control blocks
- 2**
Unable to obtain the 64-bit common storage for internal control blocks
- 3**
Internal error

System action

TCP/IP processing continues, but applications will not be able to use the real-time application-controlled TCP/IP trace NMI.

Operator response

Save the system log for problem determination and contact the system programmer.

System programmer response

When the NMI has been disabled, the TCP/IP stack must be recycled to enable it. Use the *rsncode* value to determine what action to take before recycling the TCP/IP stack:

- 1**
Increase the size of the TCP/IP address space to ensure that enough private storage is available for use by the NMI. If you continue to receive this message with a *rsncode* value of 1, obtain a dump of the TCP/IP address space and examine the private storage usage. Under IPCS, you can use the z/OS Communications Server **TCPIP CS MAP** command to examine information from the dump about storage use by the TCP/IP stack. See [TCPIP CS MAP](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for more information about this command.
- 2**
The amount of 64-bit common storage is controlled by the HVCOMMON parameter in member IEASYSxx of PARMLIB. For more information about this parameter, see the [z/OS MVS Initialization and Tuning Reference](#). You can use the MVS console command **D VIRTSTOR, HVCOMMON** to display the summary information about the current use of the HVCOMMON storage on the MVS systems. For more information about this command, see the [z/OS MVS System Commands](#). Review the value specified on the HVCOMMON parameter to determine whether it should be increased. If you continue to receive this message with a *rsncode* value of 2, obtain a system dump and examine the 64-bit common storage usage. Under IPCS, you can use the **RSMDATA HVCOMMON** command to display detailed information about the users of the storage and the ranges in use. For more information about this command, see the [z/OS MVS Diagnosis: Reference](#).
- 3**
Obtain a dump of the TCP/IP address space and contact the IBM support center.

Explanation

QDIO Accelerator will accelerate only Sysplex Distributor traffic. Routed traffic cannot be accelerated for one of the following reasons:

- You have no IP security filters configured in your TCP/IP profile, or the current IP security filters configured in your TCP/IP profile do not explicitly permit all routed traffic.
- Filter logging is enabled for routed traffic in your TCP/IP profile.

To satisfy your configured IP filters, routed traffic must be processed by the TCP/IP stack, where IP filtering is implemented.

System action

Processing continues with QDIO Accelerator enabled only for sysplex distributor traffic.

Operator response

Contact the system programmer.

System programmer response

No action is required if any of the following conditions are true:

- Your security policy requires some routed traffic to be denied
- Your security policy requires some routed traffic to be protected using IPsec
- Your security policy requires some routed traffic to be subject to filter logging
- You do not want to use QDIO acceleration for your routed traffic

If your security policy allows all routed traffic to be permitted and does not require any routed traffic to be subject to filter logging, you can change the IP security filters configured in your TCP/IP profile so that QDIO Accelerator is enabled for routed traffic. To do this, modify the IPSEC statement in your TCP/IP profile:

1. Ensure that the first IPv4 IPSECRULE statement with a ROUTING specification of ROUTED or EITHER permits all IPv4 addresses, all protocols, and all security classes.

Tip: If your rule has a ROUTING specification of EITHER, it applies to both local and routed traffic. If your security policy does not allow you to permit all local traffic, split this rule into two rules, one with a ROUTING specification of ROUTED and one with a ROUTING specification of LOCAL.

2. Ensure that this IPSECRULE statement does not specify LOG to enable filter logging.

For more information, see [QDIO Accelerator and IP security in z/OS Communications Server: IP Configuration Guide](#).

User response

2

Automation

You can automate on this message to detect situations when routed traffic is not being QDIO accelerated because of IP filtering rules.

Example

```
EZD2020A QDIO ACCELERATOR IS ENABLED ONLY FOR SYSPLEX DISTRIBUTOR BECAUSE OF TCPIP PROFILE FILTER RULES
```

EZD2021A

**QDIO ACCELERATOR IS ENABLED ONLY FOR SYSPLEX DISTRIBUTOR
BECAUSE OF POLICY FILTER RULES**

Explanation

QDIO Accelerator will accelerate only Sysplex Distributor traffic. Routed traffic cannot be accelerated for one of the following reasons:

- The current IP security filters in your policy configuration do not explicitly permit all routed traffic.
- Filter logging is enabled for routed traffic in your policy configuration.

To satisfy your configured IP filters, routed traffic must be processed by the TCP/IP stack, where IP filtering is implemented.

System action

Processing continues with QDIO Accelerator enabled only for sysplex distributor traffic.

Operator response

Contact the system programmer.

System programmer response

No action is required if any of the following conditions are true:

- Your security policy requires some routed traffic to be denied
- Your security policy requires some routed traffic to be protected using IPsec
- Your security policy requires some routed traffic to be subject to filter logging
- You do not want to use QDIO acceleration for your routed traffic

If your security policy allows all routed traffic to be permitted and does not require any routed traffic to be subject to filter logging, you can change the IP security filters in your policy configuration so that QDIO Accelerator is enabled for routed traffic. To do this, modify your policy configuration:

1. If you are using the IBM Configuration Assistant for z/OS Communications Server to configure your IPsec policy:

- a. Ensure that the first connectivity rule that applies to routed IPv4 traffic specifies a topology of *filtering* only, applies to all IPv4 addresses, and uses a requirement map that maps all IP protocols and all security classes to a security level of Permit.

Tip: Your connectivity rule might apply to both local and routed traffic. If your security policy does not allow you to permit all local traffic, split this rule into two rules, one that applies to filtering for routed traffic, and one that applies to filtering for local traffic.

- b. Ensure that this connectivity rule specifies that filter matches are not to be logged.

2. Otherwise, if you are manually configuring your IPsec policy:

- a. Ensure that the first IpFilterRule statement whose associated IpService statement has a Routing specification of Routed or Either permits all IPv4 addresses, permits all protocols and all security classes, and has a Direction specification of Bidirectional.

Tip: If your rule has a Routing specification of Either, it applies to both local and routed traffic. If your security policy does not allow you to permit all local traffic, split this IpFilterRule into two filter rules, one with a Routing specification of Routed and one with a Routing specification of Local.

- b. Ensure that this IpFilterRule statement's associated IpGenericFilterAction statement does not specify an IpFilterLogging setting of Yes to enable filter logging.

For more information, see [QDIO Accelerator and IP security in z/OS Communications Server: IP Configuration Guide](#).

2

Automation

You can automate on this message to detect situations when routed traffic is not being QDIO accelerated because of IP filtering rules.

Example

```
EZD2021A QDIO ACCELERATOR IS ENABLED ONLY FOR SYSPLEX DISTRIBUTOR BECAUSE OF POLICY FILTER RULES
```

EZD2022A

**QDIO ACCELERATOR IS ENABLED ONLY FOR SYSPLEX DISTRIBUTOR
BECAUSE OF DEFENSIVE FILTER RULES**

Explanation

QDIO Accelerator will accelerate only Sysplex Distributor traffic. Routed traffic cannot be accelerated because the defensive filters managed by the defense manager daemon (DMD) are being used to block some routed traffic. To satisfy the defensive filters, routed traffic must be processed by the TCP/IP stack, where defensive filtering is implemented.

System action

Processing continues with QDIO Accelerator enabled only for sysplex distributor traffic.

Operator response

Contact the system programmer.

System programmer response

Defensive filters are usually added to block a temporary security condition such as an attack or scan. The defensive filters causing this condition are removed when their configured expiration time passes. You can wait for the filters to expire.

Before these defensive filters expire, you can work with the security administrator to evaluate whether the filters are still needed. If the defensive filters are no longer needed, the security administrator can use the **<ipsec -F command>** to delete them.

For more information, see [QDIO Accelerator and IP security in z/OS Communications Server: IP Configuration Guide](#).

2

Automation

You can automate on this message to detect situations when routed traffic is not being QDIO accelerated because of defensive filter rules.

Example

EZD2022A QDIO ACCELERATOR IS ENABLED ONLY FOR SYSPLEX DISTRIBUTOR BECAUSE OF DEFENSIVE FILTER RULES

EZD2023I

QDIO ACCELERATOR IS ENABLED WITH CURRENTLY INSTALLED IP FILTER RULES

Explanation

QDIO Accelerator is enabled for all traffic because the installed IP filters permit all routed traffic to pass through the associated TCP/IP stack. Therefore, that traffic can be accelerated without requiring special processing by the TCP/IP stack.

System action

Processing continues.

Operator response

No action is needed.

```

EZD2026I	<i>Tcpname GSK_FIPS_STATE_SET FAILED FOR AT-TLS GROUP group_name WITH RETURN CODE gsk_status description</i>
-----------------	---

Explanation

The AT-TLS group *group_name* is configured with one of the following FIPS140 values: On, Level1, Level2, Level3.. *Tcpname* received an error from the System SSL Certificate Management Services (CMS) API *gsk_fips_state_set*. The *gsk_fips_state_set* API is documented in [z/OS Cryptographic Services System SSL Programming](#). AT-TLS services are not available for *group_name*.

In the message text:

Tcpname
The name of the TCPIP stack

group_name

The name of the AT-TLS group that is specified on a TTLSGroupAction statement

gsk_status

The hexadecimal gsk_status code that is returned from gsk_fips_state_set()

description

Describes the meaning of *gsk_status*

System action

TCP/IP continues. AT-TLS services are not available for the AT-TLS group specified by the *group_name* value.

Operator response

Contact the system programmer.

System programmer response

For more information about the error, see [CMS status codes \(03353xxx\)](#) in [z/OS Cryptographic Services System SSL Programming](#). If the CSFSERV resource class is active, review RACF CSFSERV resource requirements in [z/OS Cryptographic Services System SSL Programming](#) and ensure that the user ID for *Tcpname* has access to the appropriate resources in this class.

User response

None.

Problem determination

Test  
has failed when attempting to use ICSF
```

EZD2027I

Initiation of UDP encapsulated IKE version *major.minor* security
association *generation* for tunnel *ID* is not permitted following DVIPA

takeover; the remote peer is behind an NAPT, or is acting as a security gateway

Explanation

Negotiation of a UDP encapsulated security association (SA) following a dynamic virtual IP address (DVIPA) takeover was denied.

When performing UDP encapsulation, the z/OS host is limited to acting in responder mode when the remote peer is behind a network address port translation (NAPT) device, or is acting as a security gateway. See [configuration scenarios supported for NAT traversal in z/OS Communications Server: IP Configuration Guide](#) for more information.

Additional diagnostic messages that have the same message instance number will be issued to identify the impacted SA. The message instance number precedes the message number in the log output and is used to group related messages from the Internet Key Exchange (IKE) daemon.

In the message text:

major.minor

The major and minor version of the IKE protocol for the SA.

generation

The number used to differentiate SAs for the same tunnel. The first SA created for a tunnel is number 1.

ID

The tunnel prefix and number used to identify the tunnel. The tunnel prefix is K for an IKE tunnel and Y for a dynamic tunnel.

System action

The SA for the DVIPA was not reestablished; IKE daemon processing continues.

Operator response

Examine the IKE syslog to determine the remote peer. Attempt to recover the SA by initiating the SA negotiation from the remote security endpoint. See [configuration scenarios supported for NAT traversal in z/OS Communications Server: IP Configuration Guide](#) for more information.

System programmer response

None.

User response

Module

CommonIPsecSA.cpp

Routing code

Not applicable for syslog message.

Descriptor code

Not applicable for syslog message.

Automation

This message goes to the syslog.

Example

```
EZD2027I Initiation of UDP encapsulated IKE version 2.0 security association 0  
for tunnel Y0 is not permitted following DVIPA takeover;  
the remote peer is behind an NAT or is acting as a security gateway
```

EZD2028I***ResourceType ResourceName Activation failed – Reason***

Explanation

A configuration error was detected during activation of the resource (device or interface).

In the message text:

ResourceType

The type of resource that failed activation. Possible values are device or interface.

ResourceName

The name of the device or interface.

Reason

Reason indicates the cause of the failure and can be one of the following:

An MPC group is defined as MPCUSAGE=EXC and is already in use

The MPC group that this user is trying to use is coded for exclusive use (MPCUSAGE=EXC), and it is already in use by another user.

IQDCHPID is not specified when multiple IQD CHPIDs are available

Multiple IQD (HiperSockets) CHPIDs are defined on this LPAR, and VTAM start option IQDCHPID does not specify which is to be used for dynamic XCF connectivity.

IQDIO devices are not available to build an MPC group

An attempt was made to build an iQDIO MPC group, but VTAM could not find at least three subchannel devices associated with the same IQD CHPID.

IQDIO IQD CHPID is in conflict with sysplex IQD CHPID

The user defined an iQDIO device CHPID on a TCP/IP DEVICE or INTERFACE statement and it conflicts with the sysplex IQD CHPID defined by the IQDCHPID VTAM start option for DYNAMICXCF communication.

Processor is not IQD capable

The processor does not support IQD CHPIDs.

IQDIO or OSA CHPID is not available to build an MPC group

An attempt to activate an IQDIO or OSA CHPID was rejected because the CHPID was not found.

- For iQDIO, one of the following conditions occurred:
 - When attempting dynamic XCF HiperSockets, either the VTAM start option IQDCHPID=NONE was coded, or the IQDCHPID value specified a CHPID that was not defined to the LPAR.
 - A TCP/IP HiperSockets DEVICE or INTERFACE statement specified a CHPID value that was not defined to the LPAR.

- For OSA-Express, the CHPID value specified on the TRLE or TCP/IP DEVICE or INTERFACE statement was not defined to the LPAR.

OSA control channels are not available to build an MPC group

Two consecutive subchannel addresses, starting with an even number, are required when dynamically building a TRLE for OSA-Express devices that use queued direct I/O (QDIO). The consecutive subchannel addresses are required for the READ and WRITE control channels. The CHPID was found for the failing device, but two consecutive subchannel addresses starting with an even number were not found.

Incorrect PORTNAME or TRLENAME is specified

For devices and interfaces where the TRLE is defined in VTAM and not dynamically generated, the DEVICE or INTERFACE statement must point to a valid TRLE. Either the PORTNAME value, TRLENAME value, or DEVICE name does not match a corresponding value on a TRLE statement.

PNETID is not configured

An IBM 10 GbE RoCE Express feature configured on the GLOBALCONFIG statement does not have a physical network ID.

No datapath device addresses are available

A QDIO or IQDIO device or interface activation failed because there were no datapath devices available.

The channel unit address is not available

The device is attempting to use a channel unit address (CUA) that is not defined or not available.

An incorrect channel unit address is specified

The device is attempting to use an incorrect channel unit address (CUA).

The channel unit address is already in use

The channel unit address (CUA) is being used by other resources.

QDIO CHPID type mismatch is detected

The CHPID type for the OSA-Express device using QDIO does not match the type of CHPID that it is attempting to use.

OSM/OSX activation not permitted because LPAR is not in Ensemble

Activating OSM or OSX interface is not supported because the LPAR is not participating in an Ensemble.

OSM/OSX activation not permitted because CPC is not in Ensemble

Activating OSM or OSX devices is not supported because the CPC is not configured as a member of an Ensemble.

IQD activation is not permitted against an IQDX device

The DEVICE or INTERFACE statement for the failing resource specifies a HiperSockets CHPID that is defined with the Internal Queued Direct I/O extensions (IQDX) function of HiperSockets. A CHPID with the IQDX function is reserved for IQDX communications and cannot be specified on the DEVICE or INTERFACE statement.

Portname is already in use by another port on this CHPID

An attempt was made to activate OSA-Express port in QDIO mode. The portname used on this activation attempt was already in use on the other port on this CHPID. Two ports on the same CHPID cannot have the same portname.

Different portname is already assigned to OSA

An attempt was made to activate OSA-Express port in QDIO mode. The portname for this activation attempt did not match the portname already assigned to this port by a previous user. All z/OS users of a port must activate it with the same portname.

IQD activation is not permitted against an IQDC device

The DEVICE or INTERFACE statement for the failing resource specifies a HiperSockets CHPID that is defined with the Internal Queued Direct I/O extensions (External Bridge) function of HiperSockets. A CHPID with the External Bridge function is reserved for IQDC communications and cannot be specified on the DEVICE or INTERFACE statement.

OSH device not available to activate EQENET interface

An attempt was made to activate an EQENET interface using the configured DEVNUM value. No OSH devices associated with the CHPID of the specified DEVNUM value were found to be available for use.

System action

TCP/IP marks the device or interface inactive.

Operator response

Contact the system programmer.

System programmer response

Depending on the value of *Reason*, take the following actions:

An MPC group is defined as MPCUSAGE=EXC and is already in use

Ensure that there is only one user of a TRLE defined with MPCUSAGE=EXC. A user can be a TCP/IP device or interface, or a VTAM PU.

IQDCHPID is not specified when multiple IQD CHPIDs are available

When more than one IQD CHPID is defined, VTAM start option IQDCHPID must specify the one that is to be used for dynamic XCF connectivity. Choose which CHPID is to be used for dynamic XCF, and specify it on the IQDCHPID VTAM start option. Also, ensure that the CHPID to be used for dynamic XCF is not used on a HiperSockets device of type MPCIPA, or a HiperSockets interface of type IPAQIDIO or IPAQIDIO6 for any stack on the LPAR. The CHPID specified on IQDCHPID is reserved for dynamic XCF connectivity.

IQDIO devices are not available to build an MPC group

Verify the Hardware Configuration Definition (HCD) or Input Output Control Data Set (IOCDS) configuration for accuracy for this logical partition. The HCD configuration might need to be updated to specify a sufficient number of HiperSockets devices.

IQDIO IQD CHPID is in conflict with sysplex IQD CHPID

- If dynamic XCF connectivity is required, ensure that no TCP/IP DEVICE or INTERFACE statement specifies the same CHPID that is defined for XCF connectivity on the IQDCHPID VTAM start option.
- If dynamic XCF connectivity is not required, ensure that DYNAMICXCF is not defined on the TCP/IP IPCONFIG or IPCONFIG6 statement, or specify IQDCHPID=NONE as a VTAM start option.

Processor is not IQD capable

Remove all TCP/IP HiperSockets DEVICE and INTERFACE statements. They are not available on this processor.

IQDIO or OSA CHPID is not available to build an MPC group

Ensure that the CHPID defined for the OSA-Express or HiperSockets DEVICE or INTERFACE is defined for this LPAR.

OSA control channels are not available to build an MPC group

Ensure that sufficient subchannel addresses exist for all users of the TRLE, and that at least two addresses are consecutive starting with an even number for the two control channels.

Incorrect PORTNAME or TRLENAME is specified

For the failing device or interface, determine which VTAM TRLE definition should be used.

- If the TRLE is identified on the INTERFACE statement by the PORTNAME parameter, ensure that the PORTNAME parameter contains a value that matches the PORTNAME parameter on the VTAM TRLE statement.
- If the TRLE is identified on the INTERFACE statement by the TRLENAME parameter, ensure that the TRLENAME parameter contains a value that matches the TRLE name of the VTAM TRLE statement.
- If the port name is identified on the DEVICE statement by a DEVICE name, ensure that the DEVICE name matches the PORTNAME parameter on the VTAM TRLE statement.
- Verify the TRLE is in an active state using the D NET,TRL,TRLE operator command documented in the [z/OS Communications Server: SNA Operation](#). If the TRLE shows as not active or if you get IST172I NO TRLES EXIST, then investigate why the TRLE is not active. Check for any supplemental VTAM error messages in the VTAM job log or system log.

PNETID is not configured

Configure a physical network ID for the 10 GbE RoCE Express feature in HCD or remove the PCI-function ID (PFID) definition representing the 10 GbE RoCE Express feature from the SMCR parameter of the GLOBALCONFIG statement.

No datapath device addresses are available

Ensure that there are sufficient datapath device addresses defined for the device.

- When the TRLE is defined in VTAM, define sufficient DATAPATH addresses on the TRLE statement for all users of the TRLE. See [DATAPATH](#) in [z/OS Communications Server: SNA Resource Definition Reference](#) for more information about how many DATAPATH addresses are required for your configuration.
- When the TRLE is dynamically generated by VTAM, a certain number of DATAPATH addresses are dynamically allocated depending on the type of device and the number of addresses defined in HCD for the device. See [Resources automatically activated by VTAM in z/OS Communications Server: SNA Network Implementation Guide](#) for more detail about how many DATAPATH addresses are allocated.

The channel unit address is not available

Verify that the channel unit address is defined in HCD or IOCDS and that it is varied online.

An incorrect channel unit address is specified

Verify that the channel unit address is correctly defined. Verify that both READ and WRITE CUAs are specified if they are both required. For an EQENET interface activation failure, verify the DEVNUM value specified on the EQENET interface represents a device associated with an OSH CHPID.

The channel unit address is already in use

Verify that the device uses a channel unit address that is not in use by another user. Examples of other users are another TCP/IP stack on this LPAR, or VTAM.

QDIO CHPID type mismatch is detected

Verify that the CHPID type specified or defaulted on the configuration statement is the same as the type that is assigned to this device.

OSM/OSX activation not permitted because LPAR is not in Ensemble

Enable LPAR participation in the Ensemble by specifying the ENSEMBLE=YES VTAM start option.

See [configuring a node to participate in an ensemble](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information about Ensembles.

OSM/OSX activation not permitted because CPC is not in Ensemble

If connectivity to the intraensemble data network or intranode management network is needed, ensure that the LPAR is configured as a member of the Ensemble. See [configuring a node to participate in an ensemble](#) in [z/OS Communications Server: IP Configuration Guide](#) for more information about Ensembles.

IQD activation is not permitted against an IQDX device

Either remove the HiperSockets DEVICE or INTERFACE statement, or specify a different HiperSockets CHPID. For more information about the IQDX function, see [HiperSockets connectivity to the intraensemble data network](#) in [z/OS Communications Server: IP Configuration Guide](#).

OSH device not available to activate EQENET interface

Verify that the HCD or the IOCDS configuration defines a sufficient number of devices for the OSH CHPID associated with the DEVNUM value specified on the EQENET interface. For more information, see the DEVNUM parameter on the EQENET Network Express Enhanced QDIO interfaces statement in [z/OS Communications Server: IP Configuration Reference](#)

Tip: Each defined EQENET interface requires a single available and online OSH device to successfully activate.

Portname is already in use by another port on this CHPID

Identify the portname of the failing DEVICE or INTERFACE statement. It is specified as the DEVICE name on a DEVICE statement and as the PORTNAME value on an INTERFACE statement. Change the portname value on the DEVICE or INTERFACE statement and on the PORTNAME operand on the TRLE representing this port to a name that is unique on this CHPID.

Different portname is already assigned to OSA

Identify all users of the port and ensure that the portname is the same for all users. Users might be other TCP/IP stacks on this LPAR, or TCP/IP stacks on other LPARs.

IQD activation is not permitted against an IQDC device

Either remove the HiperSockets DEVICE or INTERFACE statement, or specify a HiperSockets CHPID that is not defined with the External Bridge function. For more information about the IQDC function, see [HiperSockets Converged Interface overview in z/OS Communications Server: IP Configuration Guide](#).

EZD2030I **TOO MANY VIPADEFINE AND VIPABACKUP VIPAS - ipaddr REJECTED**

Explanation

There are already 1024 active and backup dynamic or moveable VIPAs on this stack. These VIPAs were defined using a combination of VIPADYNAMIC VIPADEFINE and VIPADYNAMIC VIPABACKUP statements on this stack and VIPADYNAMIC VIPADISTRIBUTE statement on other stacks. The specified IP address is not defined to the stack.

System action

TCP/IP continues.

Operator response

Correct the appropriate definitions and try the command or activation again.

System programmer response

Reduce the number of defined or backup Dynamic VIPAs for this stack or remove this stack as a distribution target used by other stacks.

User response

No action is needed.

Problem determination

See the System Programmer Response.

```

EZD2031I**SMC APPLICABILITY TOOL HAS STARTED COLLECTING DATA**

Explanation

This message is a result of the **VARY TCPIP, ,SMCAT** command and indicates that the SMC applicability tool has started collecting data.

System action

The system begins to collect data for the SMCAT report and displays the **VARY TCPIP, ,SMCAT** command configuration parameters by issuing message EZD2040I to the system log and job log.

Operator response

Do one of the following actions:

- Wait until the current data collection interval expires. To determine when the interval expires, review the console messages to determine when the tool was turned on.
- Use the **VARY TCPIP, ,SMCAT,OFF** command to turn the tool off.

See ["VARY TCPIP,,SMCAT" command](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for more information about the SMC applicability tool.

EZD2035I	NAME SERVER <i>ipaddress</i> Message Format: NAME SERVER <i>ipaddress</i> STATUS: <i>status</i> <i>percent</i>	FAILURE RATE:
-----------------	---	----------------------

Explanation

This is a multi-line message that is issued by the resolver in response to a MODIFY RESOLVER,DISPLAY command or a MODIFY RESOLVER,REFRESH command when the autonomic quiescing of unresponsive name servers function is active. The resolver issues a message for each name server specified on an NSINTERADDR statement in the global TCPIP.DATA file. The message displays the status and the DNS query failure rate for the specified name server.

In the message text:

ipaddress

The IPv4 or IPv6 network address of the name server.

status

The status of the name server specified by the *ipaddress* value. Possible values are:

ACTIVE

The resolver considers the name server to be responsive to the DNS queries that are generated by an application or by the resolver. The resolver continues to forward the DNS queries that are generated by an application to this name server.

QUIESCED

The resolver considers the name server to be unresponsive to the DNS queries that are generated by an application or by the resolver. Unless all name servers are quiesced, the resolver does not forward the DNS queries that are generated by an application to this name server. If all name servers are quiesced, the resolver sends the DNS queries that are generated by an application to the quiesced name servers, instead of immediately failing the query.

percent

The DNS query failure rate that was calculated by the resolver at the last monitoring checkpoint for the name server specified by the *ipaddress* value. The DNS query failure rate is the sum of the DNS queries that are generated by applications or by the resolver that received no response divided by the total number of DNS queries that are generated by an application or by the resolver that were sent during a checkpoint interval. The percent value is a value in the range 0% - 100%. The value *N/A* is displayed when the resolver was unable to calculate a DNS query failure rate at the last monitoring checkpoint. The resolver might be unable to calculate a DNS query failure rate for the following reasons:

- The resolver sent less than total ten DNS queries to the name server. The resolver requires a sample set of ten DNS queries during a monitoring interval to declare that a name server is unresponsive.
- The resolver has detected recent system changes, such as activation of the TCPIP stack, which might affect name server responsiveness. The resolver delays declaring that a name server is unresponsive for a predefined period of time after such system changes.

System action

Processing continues.

Operator response

- Contact the system programmer if one or more name servers display the QUIESCED status.
- Contact the system programmer if the network is experiencing delays and one or more name servers display the ACTIVE status with a nonzero DNS query failure rate.

System programmer response

If the status of a name server is QUIESCED, perform one of the following actions:

- If a network condition is preventing resolver requests or name server responses from reaching the correct destination, correct the network condition. When the name server successfully responds to resolver polling queries, the resolver will resume sending DNS queries that are generated by an application to the name server.
- If a configuration error is causing the name server to be unresponsive, use resolver diagnostic tools such as the MODIFY RESOLVER,DISPLAY command or the Trace Resolver output to determine which of the following conditions is causing the error:
 - If the IP address is no longer valid as a name server, remove the IP address from the list of name servers to be used by the resolver. The list of name servers is defined by using the NSINTERADDR or NAMESERVER configuration statement in the global TCPIP.DATA file.
 - If the RESOLVERTIMEOUT value is too low for responses to consistently return from the name server within the specified time value, increase the timeout setting to a value that permits a larger percentage of responses to arrive within the timeout interval.

After you correct the configuration error, instruct the operator to issue the MODIFY RESOLVER,REFRESH command.

- If you eliminate a network condition and a configuration error as the reason for the message, the resolver might be generating the message for a temporary condition that might resolve itself. For example, the name server might be having maintenance applied, or the name server might have a very high percentage of failures because few queries were sent to the name server during the monitoring interval. Even a short network interruption can severely impact the calculations. If this situation repeats itself, an overly aggressive UNRESPONSIVETHRESHOLD value might be contributing to the situation. Consider increasing the setting value for the UNRESPONSIVETHRESHOLD parameter in the resolver setup file, and then instruct the operator to issue the MODIFY RESOLVER,REFRESH,SETUP=*setup_file_name* command to make the resolver less sensitive to name server response failures.
- If you want the resolver to resume forwarding the DNS queries that are generated by an application to the name server, even if the name server is unresponsive at the current UNRESPONSIVETHRESHOLD percentage, perform one of the following actions:
 - Increase the UNRESPONSIVETHRESHOLD percentage in the resolver setup file to be greater than the displayed DNS query failure rate. For example, if the UNRESPONSIVETHRESHOLD percentage is 10%, but the name server is failing to respond to 15% of the queries, increase the threshold to a value in the range 20%. The resolver will continue to monitor the responsiveness of name servers in your network, but will forward DNS queries to this name server as long as the failure rate stays below the new threshold percentage.
 - Delete the AUTOQUIESCE operand from the UNRESPONSIVETHRESHOLD statement in the resolver setup file. The resolver will continue to monitor the responsiveness of name servers in your network, but will alert only the network operator of the unresponsive condition, and will continue to send DNS queries to all name servers.

After you modify the resolver setup file, instruct the operator to issue the MODIFY RESOLVER,REFRESH,SETUP=*setup_file_name* command.

If the status of a name server is ACTIVE with a nonzero DNS query failure rate, your network is experiencing network delays. The diagnosis of the network failures indicates that the DNS query failures are causing the network delays. You might want to decrease the unresponsive threshold percentage. A lower percentage setting causes the resolver to detect unresponsive name servers more rapidly and to stop forwarding the DNS queries that are generated by an application to those name servers sooner. Decrease the threshold percentage by coding a lower value on the UNRESPONSIVETHRESHOLD statement in the resolver setup file. You must specify a value lower than the DNS query failure rate displayed for the name server.

After you modify the UNRESPONSIVETHRESHOLD statement, instruct the operator to issue the MODIFY RESOLVER,REFRESH,SETUP=*setup_file_name* command.

EZZ9293I DISPLAY COMMAND PROCESSED
```

EZD2036I**AUTOQUIESCE IGNORED - GLOBALTCIPDATA REQUIRED**

Explanation

The resolver issues this message when the AUTOQUIESCE operand is specified on the UNRESPONSIVETHRESHOLD resolver setup statement, but no GLOBALTCIPDATA resolver setup statement is coded. The AUTOQUIESCE operand setting is ignored.

System action

The resolver uses the UNRESPONSIVETHRESHOLD percentage value to perform the network operator notification function instead of performing the autonomic quiescing of unresponsive name servers function.

Operator response

Contact the system programmer.

System programmer response

If you do not want unresponsive name servers to be automatically quiesced, perform one of the following actions:

- Remove the AUTOQUIESCE operand from the UNRESPONSIVETHRESHOLD statement, but leave the threshold percentage coded on the statement.
- Remove the UNRESPONSIVETHRESHOLD statement completely. The network operator notification function will run by default.
- Leave the resolver setup file unchanged. You will continue to see message EZD2036I every time the resolver is started or a MODIFY RESOLVER,REFRESH command is issued, but the autonomic quiescing function will not be active.

If you want unresponsive name servers to be automatically quiesced, perform the following actions:

- If you do not have a global TCPIP.DATA file, create one. Code the appropriate resolver-related TCPIP.DATA statements in the global TCPIP.DATA file you just created.
- Code the GLOBALTCIPDATA statement in the resolver setup file, specifying the name of the global TCPIP.DATA file to be used.

If you have corrected the resolver setup file, instruct the operator to issue the MODIFY RESOLVER,REFRESH,SETUP=*setup_file_name* command to activate the changes.

User response

None.

Problem determination

Automation

This message is not a good candidate for automation.

Example

```
EZD2036I AUTOQUIESCE IGNORED - GLOBALTCPIPDATA REQUIRED
```

EZD2037E	<i>resolver_setup_value</i> PROCESSING ENDED - ISSUE RESOLVER REFRESH TO REACTIVATE
-----------------	--

Explanation

This message is issued when the resolver function defined by the *resolver_setup_value* value ends abnormally. The operator can restart the resolver function by issuing a MODIFY RESOLVER,REFRESH or MODIFY RESOLVER,REFRESH,SETUP= command.

Possible values of *resolver_setup_value* are:

- AUTOQUIESCE
- UNRESPONSIVETHRESHOLD

System action

Processing continues.

- If the *resolver_setup_value* value is AUTOQUIESCE, the resolver stops performing the autonomic quiescing of unresponsive name server function, and instead performs the network operator notification of unresponsive name server function. All name servers previously identified by message [EZZ9311E](#) in [z/OS Communications Server: IP Messages Volume 4 \(EZZ, SNM\)](#) as being unresponsive are now considered responsive, and the resolver will now send the DNS queries that are generated by an application to these name servers. If the resolver determines subsequently that the name server is still unresponsive, the resolver will generate

message [EZZ9308E](#) in [z/OS Communications Server: IP Messages Volume 4 \(EZZ, SNM\)](#) to notify the network operator.

- If the *resolver_setup_value* value is UNRESPONSIVETHRESHOLD, the resolver stops performing all monitoring of unresponsive name servers. All name servers previously identified by message [EZZ9308E](#) as being unresponsive are now considered responsive. All name servers previously identified by message [EZZ9311E](#) as being unresponsive are now considered responsive, and the resolver will now send DNS queries that are generated by an application to these name servers. The resolver will not generate any additional messages [EZZ9308E](#) or [EZZ9311E](#).

The message remains on the operator console until one of the following events occurs:

- The operator issues a MODIFY RESOLVER,REFRESH command. The resolver restarts the function at the previously defined level of functionality.
- The operator issues a MODIFY RESOLVER,REFRESH,SETUP=*resolver_setup_file* command. The resolver activates the level of function defined in the *resolver_setup_file* file.
- The resolver is stopped.

Operator response

If you want the resolver to use the same level of monitoring function, issue a MODIFY RESOLVER,REFRESH command. If not, contact the system programmer.

System programmer response

If you want the resolver to use the same level of function, instruct the operator to issue a MODIFY RESOLVER,REFRESH command.

If you want the resolver to use a different level of function, first modify your resolver setup file.

- If you want the resolver to automatically quiesce unresponsive name servers, specify the AUTOQUIESCE operand on the UNRESPONSIVETHRESHOLD resolver setup statement. When the AUTOQUIESCE operand is specified, the resolver automatically stops sending the DNS queries generated by an application to unresponsive name servers. The resolver uses the threshold value specified on the UNRESPONSIVETHRESHOLD resolver setup statement to determine whether a name server is unresponsive.
- If you no longer want the resolver to automatically quiesce unresponsive name servers, delete the AUTOQUIESCE operand from the UNRESPONSIVETHRESHOLD resolver setup statement. The resolver continues to monitor the responsiveness of name servers in your network, but only alerts the network operator of the unresponsive condition. The resolver continues to send the DNS queries generated by an application to all name servers.
- If you no longer want the resolver to perform any level of monitoring of unresponsive name servers, specify the UNRESPONSIVETHRESHOLD(0) statement in the resolver setup file.

After you modify the resolver setup file, instruct the operator to issue the MODIFY RESOLVER,REFRESH,SETUP=*setup_file_name* command.

User response

Not applicable.

Problem determination

In most cases, the resolver will generate a dump in addition to displaying this message. Contact IBM Service with the dump information for additional problem determination.

Descriptor code

2

Automation

This message is a good candidate for automation, if you want to restart the same level of resolver function by using the **MODIFY RESOLVER,REFRESH** command.

Example

```
EZD2037E AUTOQUIESCE PROCESSING ENDED - ISSUE RESOLVER REFRESH TO REACTIVATE
```

EZD2038I**RESOLVER INITIALIZATION COMPLETED WITH WARNINGS**

Explanation

The resolver detected errors in setup statements in the resolver setup file and issued warning messages during the initialization of the resolver address space. The resolver address space has initialized and is ready to accept **MODIFY** and **STOP** commands, and resolver services are available to applications.

System action

Processing continues.

Operator response

Save the system log and contact the system programmer.

System programmer response

Examine the system log to find the warning messages that are issued during the initialization of the resolver address space.

- If the errors in the resolver setup file did not change the resolver configuration settings from what you wanted, you can ignore the errors. If, at a later time, you want to use the same setup file as part of the **MODIFY RESOLVER, REFRESH, SETUP** command processing, correct the errors at that time.
- If the errors in the resolver setup file changed the resolver configuration settings from what you wanted, correct the errors in the setup file. See the system programmer actions defined for the warning messages that are issued by the resolver to determine the corrective actions to take. After you have corrected the errors, instruct the operator to issue a **MODIFY RESOLVER, REFRESH, SETUP** command to correct the resolver configuration settings.

User response

No action is needed.

Problem determination

None.

Automation

This message is displayed at the operator console and is suitable for automation. You can use it to detect resolver setup file errors that might impact your system operations.

Example

```
EZD2038I RESOLVER INITIALIZATION COMPLETED WITH WARNINGS
```

EZD2039I**WARNINGS ISSUED DURING RESOLVER INITIALIZATION**

Explanation

The resolver includes this message in the response to a **MODIFY RESOLVER,DISPLAY** command if the resolver issued warning messages during the initialization of the resolver address space and you did not subsequently issue a **MODIFY RESOLVER,REFRESH,SETUP** command to correct the errors.

System action

Processing continues.

Operator response

Save the resolver configuration settings and contact the system programmer.

System programmer response

Examine the resolver configuration settings.

- If the resolver configuration settings are accurate, you can ignore this message.
- If the resolver configuration settings are not accurate, examine the system log from the time when the resolver address space initialized to determine which warning messages the resolver issued. See the system programmer response for those warning messages to determine the corrective actions to take. After you correct the errors in the setup file, instruct the operator to issue a **MODIFY RESOLVER,REFRESH,SETUP** command to correct the resolver configuration settings.

User response

No action is needed.

EZD2041I IP ADDRESS 201.0.1.1 ALREADY SPECIFIED	
EZD2042I	<i>Tcpname</i> FAILURE DETECTED IN AT-TLS GROUP <i>group_name</i> GRPID <i>gid</i> RSN <i>rsncode</i>

Explanation

Application Transparent Transport Layer Security (AT-TLS) detected a failure in the AT-TLS group that is identified by the group name and group ID.

In the message text:

Tcpname
The name of the TCP/IP stack where the failure was detected

group_name
The name of the AT-TLS group that is specified on a TTLSGroupAction statement

gid

A hexadecimal value that uniquely identifies the AT-TLS group that supports the connection or SSL environment

rsncode

An IBM internal reason code

System action

TCP/IP continues. The AT-TLS group *group_name* is marked as failed. Any connections that attempt to use that group are reset. AT-TLS sets a return code of 5018 for those connections.

Operator response

Save the system log for problem determination and contact the system programmer. A Policy Agent AT-TLS policy refresh with the FLUSH option specified might recover the failed AT-TLS group for use by future connections. For more information about the effect of FLUSH option for refreshing AT-TLS policies, see [FLUSH and PURGE information in z/OS Communications Server: IP Configuration Guide](#).

System programmer response

Collect a console dump that contains the TCP/IP address space and contact IBM Software Support.

User response

```

EZD2043I

**TTLS Error GRPID: *gid* ENVID: *eid* CONNID: *cid* LOCAL: *loc_ip*..*loc_port*
REMOTE: *rem_ip*..*rem_port* JOBNAME: *jobname* USERID: *userid* RULE:
rule RC: *rcode* RSN: *rsncode* event**

Explanation

Application Transparent Transport Layer Security (AT-TLS) detected a failure during the invocation of the CELAAUTH macro for a pre-initialized environment while AT-TLS processes the specified event.

In the message text:

gid

The hexadecimal value that identifies the AT-TLS group that supports the connection or SSL environment.

eid

The hexadecimal value that identifies the AT-TLS environment that supports the connection. Multiple AT-TLS environments might be represented by a single master System SSL secure environment. If *eid* is 00000000, the event does not apply to a specific environment.

cid

A hexadecimal value that identifies this TCP connection for the life of the connection. If *cid* is 00000000, the event does not apply to a specific TCP connection.

loc_ip

The local IPv4 or IPv6 address.

loc_port

The local port number.

rem_ip

The remote IPv4 or IPv6 address.

rem_port

The remote port number.

jobname

The job name of the application that is associated with this TCP connection.

uesrid

The user ID of the application that is associated with this TCP connection.

rule

The name of the AT-TLS rule that mapped this TCP connection.

rcode

The CELAAUTH macro return code that indicates why the event failed. The *rcode* values are defined in [z/OS Language Environment](#)[®].

rsncode

The CELAAUTH macro reason code that indicates why the event failed. The *rsncode* values are defined in [z/OS Language Environment](#).

event

The AT-TLS event that was in process when the error occurred. Possible values are:

CELA READ

The TCP connection was attempting to decrypt secure data.

CELA WRITE

The TCP connection was attempting to encrypt secure data.

CELA SHUTDOWN

The TCP connection was attempting to shutdown the secure session.

CELA VALIDATEHOST

The TCP connection was attempting to validate the host name that was specified in a peer X.509 certificate.

System action:

TCP/IP continues. The pre-initialized environment that encountered the failure is stopped. The TCP connection that is associated with the specified event is ended.

Operator response

None.

System programmer response

The message creation time and owning TCP/IP job name of the process that created this message are included in the syslog trace before the message ID. The message has a syslog priority of ERROR and is written to the syslog when AT-TLS trace option ERROR(2) is specified.

Collect the syslogd log and a console dump that contains the TCP/IP address space and contact IBM Software Support.

User response:

None.

Problem determination:

See the system programmer response.

EZD2044I

A refresh of IKEv2 security association *sa_generation* for tunnel *tunnel_id* was not scheduled due to the expiration of the remote security endpoint certificate in *secs* seconds

Explanation

This message is issued when a refresh for an Internet Key Exchange version 2 (IKEv2) Security Association (SA) was not scheduled because the lifetime of the SA expires at the same time the certificate used to authenticate the remote security endpoint expires. This message indicates that the remote security endpoint needs to re-authenticate by creating a new IKE SA and using a different certificate. If the remote security endpoint attempts to reuse the same certificate, message EZD1038I will be issued.

In the message text:

sa_generation

The number used to differentiate SAs for the same tunnel. The first SA that is created for a tunnel is number 1.

tunnel_id

The tunnel prefix and number used to identify the tunnel. The tunnel prefix is K for an IKE tunnel and Y for a dynamic tunnel.

secs

The number of seconds remaining before the remote security endpoint certificate expires.

System action:

IKE daemon processing continues.

Example

```
EZD2045I VIPARANGE 10.9.9.9 WITH ZCX REJECTED - SAMEHOST NOT DEFINED ON TCPCS
```

EZD2046I

A create signature request to the NSS server failed; a matching certificate for local security endpoint identity *local_id* and authentication method *auth_method* was found but was not signed by a CA requested by the peer.

Explanation

The IKE daemon made a network security certificate services request to create a digital signature. A certificate matching the local security endpoint identity and authentication method was found on the network security services (NSS) server key ring, but the certificate was not signed by a certificate authority (CA) requested by the peer.

The IKE peer can send one or more certificate request payloads which requests that the local IKE send a certificate signed by one of the specified CAs. For an IKEv1 negotiation, if a certificate is found that matches the local security endpoint identity but is not signed by a specified CA, the create signature request fails. Message EZD2046I is generated to identify this failure.

In the message text:

local_id

The local security endpoint identity

auth_method

The authentication method

System action

The request fails; the IKE daemon continues.

Operator response

Contact the system programmer.

System programmer response

Determine the CA that signed the matching certificate on your local key ring. Contact the administrator of the remote security endpoint to determine what CAs are being requested. Either the peer must be updated to accept a certificate signed by the CA that signed the local certificate or a certificate must be added to the local NSS key ring that is signed by a CA acceptable to the peer.

User response

Not applicable.

Problem determination

You can perform the following steps to determine the CAs being requested by the remote peer:

1. Update IkeSyslogLevel in the IKED configuration file to include level 8, IKE_SYSLOG_LEVEL_FMTPKTTRC, in addition to any existing levels that you have enabled.
2. Retry the security association negotiation.
3. Review the IKED syslogd output. If the peer is sending one or more certificate request payloads, each will be labeled "Certificate Request Payload" in a formatted receive message in the syslogd output. The certificate request payloads identify the CAs that the peer is requesting.

but was not signed by a CA requested by the peer.
```

EZD2047I**LOAD FOR MODULE *modname* FAILED, RETURN CODE: *return_code***

Explanation

An attempt to load a Telnet load module failed. Telnet cannot complete its initialization.

In the message text:

modname

The name of the Telnet load module associated with the failure

return_code

The return code from the failing LOAD macro call

System action:

Telnet ends.

Operator response:

Contact the system programmer.

System programmer response

Perform the following steps:

1. Verify that the load module exists in data set SEZALOAD, and that SEZALOAD is either in the default MVS link list or that it is explicitly specified as a STEPLIB DD card on the started procedure JCL used to start this Telnet instance.
2. If step one does not resolve the problem, examine the description of *return_code* for a LOAD macro call in [z/OS MVS Programming: Authorized Assembler Services Reference LLA-SDU](#) to identify possible problems.
3. If no problems are found in step one or two, collect any available supporting documentation and dumps, and contact the IBM software support center.

```

EZD2050I

IPsec infrastructure problem detected for stack *stackname*: reason

Explanation

The Internet Key Exchange daemon (IKED) detected a problem in the IPsec infrastructure for *stackname*. The reported problem must be resolved for *stackname* to detect any additional issues that need to be addressed.

If *stackname* is configured to monitor the IPsec infrastructure as part of sysplex monitoring, the problem reported by this message could delay *stackname* from joining the sysplex or cause *stackname* to detect an IPsec infrastructure error. The DELAYJOINIPSEC and MONIPSEC options on the GLOBALCONFIG SYSPLEXMONITOR parameter determine if *stackname* is monitoring the IPsec infrastructure. For more information on these options, see [GLOBALCONFIG statement](#) in *z/OS Communications Server: IP Configuration Reference*.

IKED monitors the availability of the Network Security Server daemon (NSSD) certificate services. However, when the IPsec infrastructure includes a primary and backup NSSD (configured in the IKED configuration file), MONIPSEC monitoring (if configured) for *stackname* does not react to failures that are related to NSSD certificate services.

Message EZD2050I is issued to report an IPsec infrastructure problem independently of how the DELAYJOINIPSEC and MONIPSEC options are configured.

In the message text:

stackname

The name of the TCP/IP stack for which the problem was detected.

reason

The problem detected in the infrastructure.

<i>Table 1. Reason values and explanation</i>	
reason values	Further explanation
An IPSec Key Exchange policy is not available	IKED does not have IPSec policy installed for negotiating security associations.
FIPS140 support for the stack and the IKE daemon are not compatible	FIPS140 is enabled for <i>stackname</i> , but FIPS140 is not enabled for IKED.
IKE daemon unable to establish socket interface to stack	IKED was unable to establish the socket interface to <i>stackname</i> . This includes the following: <ul style="list-style-type: none"> • Opening UDP sockets and binding to ports 500 and 4500 • Creating a thread to monitor for stack events • Other internal processing
IKE daemon was unable to build its certificate cache	IKED is configured to provide certificate services for <i>stackname</i> . IKED was either unable to open the certificate repository or the certificate repository does not contain at least one End Entity (EE) certificate.
NSS certificate service is not available	IKED is configured to have Network Security Server (NSS) provide certificate services for <i>stackname</i> , however, the NSS certificate service is not available.
NSS server was unable to build its certificate cache	IKED is configured to have NSS provide certificate services for <i>stackname</i> . Either NSS was unable to open the certificate repository or the Certificate Authority (CA) cache does not contain at least one CA certificate.

System action:

The IKE daemon processing continues.

Operator response:

If the problem persists, collect IKED and NSSD logs and contact the System programmer.

System programmer response

Based on the value for *reason*, perform one or more of the following steps:

<i>Table 2. Reason values and explanation</i>	
reason values	System Programmer Response
An IPSec Key Exchange policy is not available	Verify that IPSec policy is configured for <i>stackname</i> by using the z/OS UNIX pasearch command. Verify that the configured IPSec policy contains key exchange policy and IP filter rules for dynamic tunnels. That is, the policy includes a KeyExchangePolicy statement and at least one IpDynVpnAction statement.
FIPS140 support for the stack and the IKE daemon are not compatible	Verify the FIPS140 setting in <i>stackname</i> 's IPSec policy, the IKE configuration file, and optionally the NSSD configuration file. If FIPS140 support is configured for <i>stackname</i> , IKED and NSSD (if used for certificate services) must also be configured with FIPS140 support.

<i>Table 2. Reason values and explanation (continued)</i>	
reason values	System Programmer Response
IKE daemon unable to establish socket interface to stack	<p>Verify that UDP ports 500 and 4500 are reserved for the IKE daemon on the PORT statement in the TCP/IP profile.</p> <p>Review the IKED syslogd message file for additional error messages. Some of the possible related error messages are:</p> <ul style="list-style-type: none"> • EZD1065I (IKE daemon could not establish a socket) • EZD0970I (C/C++ runtime library function call failure) • EZD0952I (Error on ioctl call)
IKE daemon was unable to build its certificate cache	<p>IKED is configured to provide certificate services.</p> <ul style="list-style-type: none"> • Verify that the repository name is defined correctly in the IKE configuration file with the KeyRing parameter. • Verify that the user under which IKED was started is authorized to access the repository. • Verify that there is at least one End Entity (EE) certificate stored in the certificate cache. <p>Review the IKED syslogd message file for additional error messages. Some of the possible related error messages are:</p> <ul style="list-style-type: none"> • EZD1019I (Could not open certificate repository) • EZD1030I (The IKE daemon is not set up to support RSA signature mode of authentication using the local keyring) <p>If you do not want IKED to provide certificate services for <i>stackname</i> because you are only using pre-shared keys for IPSec peer authentication (not RSA signature), configure the NoKeyRing parameter in the IKE configuration file.</p> <p>If you want NSSD, not IKED, to provide certificate services for <i>stackname</i>, configure the NssStackConfig statement with ServiceType Cert for <i>stackname</i> in the IKE configuration file.</p>

<i>Table 2. Reason values and explanation (continued)</i>	
reason values	System Programmer Response
NSS certificate service is not available	<p>IKED is configured to have NSS provide certificate services.</p> <ul style="list-style-type: none"> • Verify that NSSD is started. • Verify that IKED is connected to NSSD. Message EZD1136I (The IKE daemon is connected to the NSS server) confirms that IKED is connected to NSSD. Message EZD1150I (The IKE daemon failed to connect to the NSS server) indicates a problem with IKED connecting to NSSD. • Verify that the IKED to NSSD connection is TLS protected. Message EZD1149I (The IKE daemon connection to the NSS server is not secure) indicates a problem with establishing TLS protection. • Verify that the NSS client (IKED) was authenticated by the NSS server by using the user ID and password/passticket provided in the IKE configuration file. A related error message is EZD1139I. • Verify that the SERVAUTH profile <code>EZB.NSS.sysname.clientname.IPSEC.CERT</code> is defined and the user ID configured in the IKE configuration file has READ access to the profile. • Verify the FIPS140 setting for <i>stackname</i> in the NSSD configuration file. If FIPS140 support is configured for <i>stackname</i> and IKED, NSSD (if used for certificate services) must also be configured with FIPS140 support. • Review the IKED and NSSD syslogd message file for additional error messages. One related error message is EZD1145I (certificate services are unavailable).
NSS server was unable to build its certificate cache	<p>IKED is configured to have NSS provide certificate services for <i>stackname</i>.</p> <ul style="list-style-type: none"> • Verify that the repository name is defined correctly in the NSS configuration file with the KeyRing parameter. • Verify that the user under which NSSD was started is authorized to access the repository. • Verify that there is at least one Certificate Authority (CA) certificate stored in the repository. <p>Review the IKED and NSSD syslogd message file for additional error messages. Some of the possible related error messages are:</p> <ul style="list-style-type: none"> • EZD1330I (Error while opening certificate repository) • EZD1331I (not a valid certificate repository name) • EZD1342I (The NSS server cannot provide certificate services using the currently configured certificate repository name)

For more information about authorizing NSS clients, see [Steps for authorizing resources for NSS in z/OS Communications Server: IP Configuration Guide](#).

User response:

No action is needed.

Problem determination:

```

EZD2051I	SMCD MULTI-SUBNET NOT SUPPORTED FOR <i>tcpstackname</i>, REQUIRED ISM FIRMWARE NOT AVAILABLE
-----------------	---

Explanation

An attempt to register usage of the Internal Shared Memory (ISM) firmware for Shared Memory Communication - Direct Memory Access (SMCD) multi-subnet support failed.

The required ISM firmware level is unavailable. This could also occur because the hardware is down-level.

In the message text:

tcpstackname

The name of the started task associated with the TCP/IP address space.

System action

The ISM device will not be used for multi-subnet environments.

Operator response

None.

System programmer response

To prevent message EZD2051I from being generated, disable SMCD multi-subnet processing by removing SYSTEID from the GLOBALCONFIG SMCD statement and any user EIDs from the GLOBALCONFIG SMCGLOBAL statement until the ISM firmware is upgraded to support SMCD multi-subnet processing.

User response

None.

Problem determination

Not applicable.

```

EZD2052I	TTLS Certificate Diagnostics GRPID: <i>gid</i> ENVID: <i>eid</i> CONNID: <i>cid</i> <i>diag_text_string</i>
-----------------	--

Explanation

Application Transparent Transport Layer Security (AT-TLS) detected an error during a TLS/SSL handshake. The error was in the validation of a peer's certificate.

The message creation time and owning TCP/IP job name of the process creating the message are included in the syslog trace preceding the message ID. This message has a syslog priority of ERROR and is written to syslogd when AT-TLS trace option ERROR (2) is specified. Error message EZD1286I provides additional information about the connection.

In the message text:

gid

The hexadecimal value that uniquely identifies the AT-TLS group supporting the connection.

eid

The hexadecimal value that uniquely identifies the AT-TLS environment supporting the connection.

cid

The hexadecimal value that uniquely identifies this TCP connection for the life of the connection. Message EZD1286I provides additional information about the connection.

diag_text_string

A diagnostic text string provided by System SSL when validation of a peer's certificate fails. The string contains information for the failing certificate. It includes the System SSL return code, the CMS return code, the certificate's Subject DN, Issuer DN, and serial number, a description of the error that occurred, and the source from which the certificate was retrieved.

The source can be the name of the key ring or key database where the certificate was found, or it can be "Handshake" if the certificate was provided by the peer during the TLS negotiation.

For more information about the System SSL return code, see [SSL function return codes](#) in [z/OS Cryptographic Services System SSL Programming](#).

For more information on the CMS return code, see [CMS status codes \(03353xxx\)](#) or [ASN.1 status codes \(014CExxx\)](#) in [z/OS Cryptographic Services System SSL Programming](#).

This diagnostic string is intended for diagnostic purposes only, and as such the information that is contained in this string can vary from release to release.

System action

The TLS negotiation fails. TCP/IP continues.

Operator response

Save the AT-TLS syslogd log file and contact the System Programmer.

System programmer response

Use the information provided in the message to determine the failing certificate and the problem encountered. If needed, increase the Trace value to include Event (8) to get messages EZD2053I and EZD2054I that identify the chain of certificates used in the failed verification.

See the [TLSConnections policy statement](#) or [TLSEnvironmentAction policy statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about setting the trace level.

See [Diagnosing Application Transparent Transport Layer Security \(AT-TLS\)](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for more information.

EZD2053I

TTLS Certificate Diagnostics Details GRPID: *gid* **ENVID:** *eid* **CONNID:** *cid*
Certificate= *count* **of** *total_count* **FailingCert=** *fail_indicator* **SubjectDN=**
<*subjectDN***>** **IssuerDN=** *<issuerDN>* **SerialNumber=** *serial_number*
CertificateSource= *cert_source*

Explanation

Application Transparent Transport Layer Security (AT-TLS) detected an error during a TLS/SSL handshake. The error was in the validation of a peer's certificate. One or more EZD2053I messages are written to provide information for each certificate in the certificate chain that is used for the validation.

The message creation time and owning TCP/IP job name of the process creating the message are included in the syslog trace preceding the message ID. This message has a syslog priority of DEBUG and is written to syslogd when AT-TLS trace option EVENT (8) is specified.

Previously issued error message EZD2052I provided general information on the certificate validation failure. Error message EZD1286I provides additional information about the connection.

In the message text:

gid

The hexadecimal value that uniquely identifies the AT-TLS group supporting the connection.

eid

The hexadecimal value that uniquely identifies the AT-TLS environment supporting the connection.

cid

The hexadecimal value that uniquely identifies this TCP connection for the life of the connection. Message EZD1286I provides additional information about the connection.

count

The position of the certificate in the chain that was evaluated. *count* is 1 for the end entity certificate provided by the remote peer. If the certificate that signed the end entity certificate is found, it is 2, and so on.

total_count

The number of certificates in the chain that was evaluated. This reflects the number of certificates that were found in the chain.

fail_indicator

fail_indicator has a value of "YES" if the certificate identified by this message is the failing certificate in the validation of the remote peer's certificate. It has a value of "NO" if the certificate identified by this message is not the failing certificate.

subjectDN

The subject distinguished name (DN) of the certificate enclosed in angle brackets <>

issuerDN

The issuer distinguished name (DN) of the certificate enclosed in angle brackets <>

serial_number

The serial number of the certificate

cert_source

The source from which the certificate was retrieved. This can be the name of the key ring or key database where the certificate was found, or it can be "Handshake" if the certificate was provided by the peer during the TLS negotiation.

System action

The TLS negotiation fails. TCP/IP continues.

Operator response

Save the AT-TLS syslogd log file and contact the System Programmer.

System programmer response

Use the information provided by one or more EZD2053I messages to determine the certificate chain used to validate the remote peer's certificate. Use these messages, along with messages EZD2052I and EZD2054I, to determine the problem encountered.

See [Diagnosing Application Transparent Transport Layer Security \(AT-TLS\) in z/OS Communications Server: IP Diagnosis Guide](#) for more information.

User response

Not applicable.

Problem determination

See the System Programmer Response.

EZD2054I

TTLS Certificate Diagnostics Data Sources GRPID: *gid* ENVID: *eid*
CONNID: *cid* Count= *num_of_data_sources* *list_of_data_sources*

Explanation

Application Transparent Transport Layer Security (AT-TLS) detected an error during a TLS/SSL handshake. The error was in the validation of a peer's certificate. Message EZD2054I is written to provide information on the data sources that were used for the failed validation of the peer's certificate.

The message creation time and owning TCP/IP job name of the process creating the message are included in the syslog trace preceding the message ID. This message has a syslog priority of DEBUG and is written to syslogd when AT-TLS trace option EVENT(8) is specified.

Previously issued error message EZD2052I provided general information about the certificate validation failure. Previously issued EZD2053I messages provided information for each certificate in the certificate chain that is used for the validation. Error message EZD1286I provides additional information about the connection.

In the message text:

gid

The hexadecimal value that uniquely identifies the AT-TLS group supporting the connection.

eid

The hexadecimal value that uniquely identifies the AT-TLS environment supporting the connection.

cid

The hexadecimal value that uniquely identifies this TCP connection for the life of the connection. Message EZD1286I provides additional information about the connection.

num_of_data_sources

The number of data sources included in the *list_of_data_sources*

list_of_data_sources

A list of the data sources that were used for the failed validation of the peer's certificate. For example, the list might contain the name of the key ring or key database that is used for the validation and "Handshake" to indicate that one or more certificates were provided by the remote peer during the TLS negotiation. Each source is separated by a comma from the previous source, with a space before and after the comma. See the example below.

System action

The TLS negotiation fails. TCP/IP continues.

Operator response

Save the AT-TLS syslogd log file and contact the System Programmer.

System programmer response

Use the information provided by EZD2054I to determine the data sources used to validate the remote peer's certificate. Use this message, along with message EZD2052I and EZD2053I, to determine the problem encountered.

See [Diagnosing Application Transparent Transport Layer Security \(AT-TLS\) in z/OS Communications Server: IP Diagnosis Guide](#) for more information.

Certificate Diagnostics RetCode= *retCode* ReasonCode= *rsnCode*
Description= *diag_text_string* SubjectDN= <*subjectDN*> IssuerDN=
<*issuerDN*> SerialNumber= *serial_number* CertSource= *cert_source*
TrustSource= *trust_source*

Explanation

A signature verification error was detected during the IKE negotiation of a security association. Either IKED or NSSD can be providing certificate services and detect the error. This message provides information about the verification failure, including the identification of the failing certificate.

In the message text:

retCode

The return error code. This is EGSKVAL indicating that the failure occurred on the gsk_validate_certificate_mode() System SSL API call that is made by NSSD or IKED.

rsnCode

The hexadecimal reason code provided by System SSL from a gsk_validate_certificate_mode() API call. See [CMS status codes \(03353xxx\)](#) or [ASN.1 status codes \(014CExxx\)](#) in [z/OS Cryptographic Services System SSL Programming](#). A 0x is pre-pended to the reason code value.

diag_text_string

A descriptive string provided by System SSL that describes the certificate validation failure

subjectDN

The subject distinguished name (DN) of the certificate enclosed in angle brackets <>

issuerDN

The issuer distinguished name (DN) of the certificate enclosed in angle brackets <>

serial_number

The serial number of the failing certificate

cert_source

The source from which the failing certificate was retrieved. This can be the name of the key ring where the failing certificate was found, or it can be "IKEPayload" if the failing certificate was provided by the peer in an IKE payload.

trust_source

The key ring that was used for certificate validation

System action

The IKE negotiation of the security association fails. The IKE daemon processing continues.

Operator response

Save the IKED syslogd log file and contact the System Programmer.

System programmer response

Use the information provided in the message to determine the failing certificate and problem encountered. If needed, activate IkeSyslogLevel 4 to get DEBUGSA messages that identify the chain of certificates used in the failed verification.

See the [IkeConfig statement](#) in [z/OS Communications Server: IP Configuration Reference](#) for information about setting the IkeSyslogLevel.

See [Error codes](#) in [z/OS Communications Server: IP Diagnosis Guide](#) for more information.

User response

Not applicable.

Problem determination

See the System Programmer Response.

EZD2056I

**ACTIVATION OF PFID *pfid* NOT ATTEMPTED - MAXIMUM NUMBER OF
RNIC PFIDS ALREADY IN USE**

Explanation

A PFID is specified on an OSA INTERFACE statement to indicate that the interface should be used for multi-subnet SMCR. There were already 32 active RNIC interfaces, which is the maximum allowed. The activation of the RNIC PFID was not attempted for the OSA INTERFACE statement for which it was defined.

In the message text:

pfid

The PFID that was specified on the OSA INTERFACE statement.

System action

The RNIC associated with the indicated PFID will not be activated. The activation of the OSA interface completed successfully.

Operator response

Save the system log for problem determination and contact the system programmer.

System programmer response

Evaluate the number of active RNICs using the Netstat DEVLINKS/-d command with the SMC option. Determine if an active RNIC can be deactivated. After reducing the number of active RNICS, only activate OSAs that will result in a maximum of 32 unique RNIC interfaces being activated. For more information, see:

- [Shared Memory Communications - Direct Memory Access in z/OS Communications Server: IP Configuration Guide](#)
- [INTERFACE - IPAQENET OSA-Express QDIO interfaces statement in z/OS Communications Server: IP Configuration Reference](#)
- [INTERFACE - EQNET Network Express Enhanced QDIO interfaces statement in z/OS Communications Server: IP Configuration Reference](#)

User response

None.

Problem determination

See the system programmer response.

Module

EZBIFIND

Routing code

2, 8

12

Automation

Not applicable for automation.

Example

```
EZD2056I ACTIVATION OF PFID 1234 NOT ATTEMPTED - MAXIMUM NUMBER OF RNIC PFIDS ALREADY IN USE
```

EZD2057I	CONFIGURATION ERROR DETECTED FOR INTERFACE <i>interface_name</i> - <i>reason</i>
-----------------	---

Explanation

A PFID is specified on an OSA INTERFACE statement to indicate that the interface should be used for multi-subnet SMCR. A configuration error was detected during the activation of the OSA or its associated RoCE Express interface.

In the message text:

interface_name

The name of the OSA or RoCE Express interface being activated.

If the identified interface name is in the form EZARIUT p ffff, where p is the port number and ffff is the PFID, this is the dynamically generated RNIC interface name associated with the PFID that was specified on the OSA INTERFACE statement.

reason

Indicates the cause of the failure and can be one of the following:

ADAPTER GENERATION DOES NOT SUPPORT ROUTABLE ROCE

The PFID specified on the OSA-Express INTERFACE statement is associated with an IBM 10 GbE RoCE Express feature that does not support Routable RoCE.

PCHID MISMATCH DETECTED

The PFID (NETH) specified on the EQENET INTERFACE SMCR statement is associated with a Network Express PCHID that does not match that of the Network Express OSH PCHID.

PNETID MISMATCH DETECTED

The PFID specified on the OSA INTERFACE statement is associated with a RoCE Express feature which has a PNetID configured that does not match the PNetID of the OSA interface.

System action

Depending on the value of *reason*, the system takes the following actions:

ADAPTER GENERATION DOES NOT SUPPORT ROUTABLE ROCE

If the PFID specified on the OSA-Express INTERFACE statement is also specified as a PFID on the GLOBALCONFIG SMCR statement, the RNIC remains active and will be used for SMC-Rv1 communications.

If the PFID specified on the OSA-Express INTERFACE statement is not specified as a PFID on the GLOBALCONFIG SMCR statement, the RNIC will be automatically deactivated since it is not configured for SMC-Rv1 and is not eligible for SMC-Rv2.

PCHID MISMATCH DETECTED

The OSH interface name identified and the configured SMC-Rv2 RNIC interface remain active. The OSH interface is not eligible for SMC-Rv2 communications.

PNETID MISMATCH DETECTED

The OSA interface name identified and the configured SMC-Rv2 RNIC interface remain active. The OSA interface is not eligible for SMC-Rv2 communications.

Operator response

Save the system log for problem determination and contact the system programmer.

System programmer response

Depending on the value of *reason*, take the following actions:

ADAPTER GENERATION DOES NOT SUPPORT ROUTABLE ROCE

Change the PFID that you specified on the OSA-Express INTERFACE statement for SMCR multi-subnet communications to be one associated with a RoCE Express2 or higher feature that supports Routable RoCE.

PCHID MISMATCH DETECTED

Change the PFID that you specified on the EQENET or IPAQENET (with DEVNUM) INTERFACE statement to be one that is associated with the Network Express feature which has the same PCHID as the OSA (OSH CHPID type) interface being activated.

PNETID MISMATCH DETECTED

Change the PFID that you specified on the OSA INTERFACE statement for SMCR multi-subnet communications to be one associated with a RoCE Express2 or higher feature which has the same PNETID as the OSA interface being activated. Alternatively, modify the physical network ID of the configured RoCE Express feature in the Hardware Configuration Definition (HCD) to match the PNetID of the OSA feature.

For more information, see:

- [Shared Memory Communications - Direct Memory Access in z/OS Communications Server: IP Configuration Guide](#)
- [INTERFACE-IPAQENET OSA-Express QDIO interfaces in z/OS Communications Server: IP Configuration Reference](#)
- [INTERFACE - EQNET Network Express Enhanced QDIO interfaces statement in z/OS Communications Server: IP Configuration Reference](#)

Example

```
EZD2057I CONFIGURATION ERROR DETECTED FOR INTERFACE QDI04103 - PNETID MISMATCH DETECTED

EZD2057I CONFIGURATION ERROR DETECTED FOR INTERFACE EZARIUT10151 - ADAPTER GENERATION DOES NOT
SUPPORT ROUTABLE ROCE
```

EZD2058I	SMCD DISABLED FOR INTERFACE <i>interface1</i> - DUPLICATE PNETID DETECTED WITH INTERFACE <i>interface2</i>
-----------------	---

Explanation

An initializing OSA interface enabled for SMCD was configured with the same PNetID as an active HiperSockets interface configured for SMCD, or an initializing HiperSockets interface enabled for SMCD was configured with the same PNetID as an active OSA interface configured for SMCD. As a result, SMCD communications will be disabled for the initializing interface.

In the message text:

- interface1***
The OSA or HiperSockets interface currently being initialized.
- interface2***
The active OSA or HiperSockets interface with the same PNetID.

System action

Initialization of the interface continues. SMCD is disabled for the interface that is initializing.

Operator response

Save the system log for problem determination and contact the system programmer.

System programmer response

Modify configuration to ensure that OSA and HiperSockets interfaces that are enabled for SMCD do not share a PNetID. Then, restart the interfaces.

For more information, see [SMC and HSCI PNetID considerations](#) in [z/OS Communications Server: IP Configuration Guide](#).

EZD2059I	VARY TCPIP,,SYSPLEX,<i>cmdtype</i> COMMAND WAS REJECTED - DVIPA MUST BE DISTRIBUTED AND OWNED BY THIS STACK
-----------------	--

Explanation

This message is additional information to message EZZ0060I.

A VARY TCPIP,,SYSPLEX command with the DISTPAUSE or DISTRESUME parameter was issued for the given DVIPA. The command was rejected because the DVIPA is not owned by this TCP/IP stack or it is not a distributed DVIPA.

In the message text:

cmdtype

The type of VARY TCPIP,,SYSPLEX command issued. Possible values are DISTPAUSE or DISTRESUME.

System action

TCP/IP continues.

Operator response

Use the DISPLAY TCPIP,,SYSPLEX,VIPADYN command to determine the status of the DVIPA. See [DISPLAY TCPIP,,SYSPLEX](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for information about issuing the command. The display will indicate the status of the DVIPA for each TCP/IP stack on each z/OS system where the DVIPA is defined or distributed. The distribution status is also shown. The VARY SYSPLEX DISTPAUSE or DISTRESUME command can only be issued on a system with a TCP/IP stack that has a status of "ACTIVE" and a distributor status of "DIST" or "BOTH".

Reissue the VARY SYSPLEX DISTPAUSE or DISTRESUME command on the z/OS system with the active distributing TCP/IP stack after correcting the command parameters. See the VARY SYSPLEX DISTPAUSE command or the VARY SYSPLEX DISTRESUME command in [z/OS Communications Server: IP System Administrator's Commands](#) for more information.

System programmer response

No action is needed.

User response

Not applicable.

Problem determination

Descriptor code

12

Automation

Not applicable for automation.

Example

```
EZZ0060I PROCESSING COMMAND: VARY TCPIP,TCPCS2,SYS,DISTPAUSE,DVIPA=10.91.1.1,PORT=8888
EZD2059I THE VARY TCPIP,,SYSPLEX,DISTPAUSE COMMAND WAS REJECTED - DVIPA MUST BE DISTRIBUTED AND OWNED
BY THIS STACK
```

EZD2060I**VARY TCPIP,,SYSPLEX,*cmdtype* REJECTED - NO MATCHING
CONFIGURED PORT ON THE VIPADISTRIBUTE STATEMENT**

Explanation

This message is additional information to message EZZ0060I.

A VARY TCPIP,,SYSPLEX command with the DISTPAUSE or DISTRESUME parameter was issued for the given DVIPA and PORT. The command was rejected because the PORT did not match a configured PORT for the DVIPA or the PORT parameter was omitted on the VIPADISTRIBUTE statement.

In the message text:

cmdtype

The type of VARY TCPIP,,SYSPLEX command issued. Possible values are DISTPAUSE or DISTRESUME.

System action

TCP/IP continues.

Operator response

Use the Netstat VIPADCFG/-F command to see all the configured PORTs for the DVIPA. You must specify one of these values when using the PORT option. If the PORT keyword was omitted on the VIPADISTRIBUTE statement, the PORT keyword cannot be specified on this command. Reissue the command on the distributing stack after correcting the command parameters. See the VARY SYSPLEX DISTPAUSE command or the VARY SYSPLEX DISTRESUME command in [z/OS Communications Server: IP System Administrator's Commands](#) for more information.

STATEMENT
```

EZD2061I

**VARY TCPIP,,SYSPLEX,cmdtype COMMAND WAS IGNORED BECAUSE IT
DOES NOT CHANGE THE CURRENT DISTRIBUTION STATE**

Explanation

This message is additional information to message EZZ0060I.

A VARY TCPIP,,SYSPLEX command with the DISTPAUSE or DISTRESUME parameter was issued for the given DVIPA and PORT. The command was ignored because it does not change the current distribution status (paused or not paused).

In the message text:

cmdtype

The type of VARY TCPIP,,SYSPLEX command issued. Possible values are DISTPAUSE or DISTRESUME.

System action

TCP/IP continues.

Operator response

Use the Netstat VDPT/-O command to see the current distribution status (paused or not paused) for the DVIPA and PORT. If the distribution status is set as you requested in the VARY SYSPLEX command, no further action is needed. Otherwise, reissue the VARY SYSPLEX DISTPAUSE or DISTRESUME command on the distributing stack to update the distribution status. See the VARY SYSPLEX DISTPAUSE command or the VARY SYSPLEX DISTRESUME command in [z/OS Communications Server: IP System Administrator's Commands](#) for more information.

```

EZD2063I

**THE VIPADISTRIBUTE PAUSE CONFIGURATION CANNOT BE MODIFIED
FOR DVIPA *ip_addr* PORT *port***

Explanation

The PAUSE configuration for the VIPADISTRIBUTE DEFINE statement does not match what is already configured for this DVIPA and port. The PAUSE configuration refers to the PAUSE parameter specified on or omitted from the VIPADISTRIBUTE statement.

In the message text:

ip_addr

The IP address of the dynamic VIPA.

port

The distributed port. A value of 00000 indicates that the VIPADISTRIBUTE statement did not specify a PORT.

System action

TCP/IP continues. The VIPADISTRIBUTE statement is rejected.

Operator response

The distribution status for the given DVIPA and port can be dynamically changed with the VARY SYSPLEX DISTPAUSE or DISTRESUME command. See the VARY SYSPLEX DISTPAUSE command or the VARY SYSPLEX DISTRESUME command in [z/OS Communications Server: IP System Administrator's Commands](#) for more information.

Issue the Netstat VDPT/-O command to determine the current distribution status (paused or not paused) to the TCP/IP stacks.

Contact your system programmer to change the PAUSE configuration on the VIPADISTRIBUTE statement.

System programmer response

Issue the Netstat VIPADCFG/-F command to determine the DVIPA configuration on this stack.

To modify the PAUSE configuration on an existing VIPADISTRIBUTE statement for the given DVIPA and port, you must first delete all previous VIPADISTRIBUTE statements for this DVIPA and port. Then, reissue the VIPADISTRIBUTE statement with the PAUSE parameter specified or omitted.

User response

Not applicable.

Problem determination

Not applicable.

Module

EZBXFDV2, EZBX6DV2

Routing code

Descriptor code

6

Automation

Not applicable for automation.

Example

```
EZD2063I THE VIPADISTRIBUTE PAUSE CONFIGURATION CANNOT BE MODIFIED FOR DVIPA 10.1.1.1 PORT 9393
```

Explanation

A VIPADISTRIBUTE DEFINE statement for this DVIPA in a VARY OBEY file is rejected on the backup stack because the distribution status was previously changed on the primary distributing stack with a VARY SYSPLEX DISTPAUSE or DISTRESUME command for the DVIPA. The distribution status, once modified using the VARY SYSPLEX DISTPAUSE or DISTRESUME command, is preserved across the sysplex.

In the message text:

ip_addr

The IP address of the dynamic VIPA.

port

The distributed port. A value of 00000 indicates that the VIPADISTRIBUTE statement did not specify a PORT.

System action

TCP/IP continues. The VIPADISTRIBUTE statement is rejected.

Operator response

The distribution status for the given DVIPA on the backup stack can be dynamically changed when it takes over distribution from the primary stack with the VARY SYSPLEX DISTPAUSE or DISTRESUME command. See the VARY SYSPLEX DISTPAUSE command or the VARY SYSPLEX DISTRESUME command in [z/OS Communications Server: IP System Administrator's Commands](#) for more information.

Issue the Netstat VDPT/-O command to determine the current distribution status (paused or not paused) to the TCP/IP stacks.

Contact your system programmer to change the PAUSE configuration on the VIPADISTRIBUTE statement.

System programmer response

Ensure that the VIPADISTRIBUTE statement is configured in the same configuration file as the VIPABACKUP statement for this DVIPA.

User response

Not applicable.

Problem determination

MODIFIED ON OWNING STACK
```

EZD2065I**VARY TCPIP,,SYSPLEX,DISTPAUSE COMMAND REJECTED – EXTTARG
DVIPA CANNOT BE PAUSED**

Explanation

This message is additional information to message EZZ0060I.

A VARY TCPIP,,SYSPLEX command with the DISTPAUSE parameter was issued for the given distributed DVIPA and port. The command was rejected because a distributed DVIPA configured on the VIPADISTRIBUTE statement with the EXTTARG parameter cannot be paused.

System action

TCP/IP continues.

Operator response

Use the Netstat VIPADCFG/-F command to see all the configured VIPADISTRIBUTE statements. You must specify a distributed DVIPA from one of these statements that does not contain the EXTTARG parameter. See the [VARY TCPIP,,SYSPLEX DISTPAUSE command](#) in [z/OS Communications Server: IP System Administrator's Commands](#) for more information.

```

EZD2066I

**CONFIGURATION ERROR DETECTED FOR INTERFACE *interface1*– OSA
PORT SHARED WITH INTERFACE *interface2* BUT DEVNUM DIFFERS**

Explanation

An EQENET or EQENET6 INTERFACE statement is defined for an OSA port that is shared with another active EQENET or EQENET6 interface. The DEVNUM specified on the two INTERFACE statements does not match.

In the message text:

interface1

The name of the interface that is being activated.

interface2

The name of the activated interface that shares an OSA port with *interface1*.

System action

The EQENET or EQENET6 interface identified by *interface1* is deactivated. Processing continues.

Operator response

Save the system log for problem determination and contact the System Programmer.

System programmer response

Modify the INTERFACE statement for the EQENET/EQENET6 interface identified by *interface1* to specify the same DEVNUM value as the INTERFACE statement for the EQENET/EQENET6 interface identified by *interface2* that uses the same shared OSA port. Then issue the VARY TCPIP,,OBEYFILE command with the updated INTERFACE statement.

For more information, see “INTERFACE – EQENET, Enhanced QDIO interface statement” and “INTERFACE – EQENET6, Enhanced QDIO interface statement” in [z/OS Communications Server: IP Configuration Reference](#) [z/OS Communications Server: IP Configuration Reference](#).

User response

OSA PORT SHARED WITH INTERFACE EQDIO4103Z BUT DEVNUM DIFFERS
```

EZD2067I **ERROR *err_code* PROCESSING *command_name* ON INTERFACE *interface***

Explanation

The error identified in the message occurred while processing the command identified by *command_name* during the EQENET/EQENET6 interface activation.

In the message text:

err_code

Error code that is returned when the command fails. For more information about the error codes, see *OSA Error Codes* in <https://www.ibm.com/docs/en/zos/2.3.0?topic=osa-z-systems-express-customers-guide-reference>.

command_name

Command that is processed when the failure occurs. Possible values are:

- ACTIVATE_DATA_QUEUES
- ENABLE_ARP_OFFLOAD
- QUERY_ASSIST
- QUERY_ASSIST_PARMS
- QUERY_SET_INTERFACE_PARMS
- QUERY_QUEUE_ID
- SET_ACCESS_CONTROL
- SET_ASSIST_PARMS
- SET_GLOBAL_NETMASK
- SET_INTERFACE_PARMS
- SET_QUEUE_ID

interface

Name of the interface in error.

System action

The EQENET or EQENET6 interface identified by *interface* is deactivated. This message is followed by EZZ4341I.

Operator response

Save the system log for problem determination and contact the system programmer. For more information about the error codes, see *OSA Error Codes* in <https://www.ibm.com/docs/en/zos/2.3.0?topic=osa-z-systems-express-customers-guide-reference>.

```
EZD2070I ERROR 043B PROCESSING ARP_SET_IP FOR IP ADDRESS 172.20.1.1 ON INTERFACE EQDI04103
```

EZD2071E	<i>target_type</i> AT DVIPA <i>ip_address</i> UNRESPONSIVE, SYSPLEX DISTRIBUTION STOPPED FOR THIS TARGET
-----------------	---

Explanation

Message EZD2071E is issued because an unexpected failure occurred between the TCP/IP stack and the external target with the given DVIPA due to an issue with the target. The sysplex distributor will not forward connections to this target until the issue is resolved.

In the message text:

target_type

The type of appliance associated with the external target DVIPA that has become unresponsive. The possible value is ZCPA.

ip_address

The IP address of the dynamic VIPA associated with the unresponsive external target.

System action

TCP/IP continues but distribution to the IP address specified in the message has stopped. TCP/IP will periodically try to reestablish the control connection with the external appliance and the message will remain until a new connection is established.

Operator response

The operator should save the z/OS system log and the appliance job log and contact the system programmer.

System programmer response

Check the z/OS system log and appliance job log for any error messages. Check the FFDC directory associated with the appliance for a recent dump or issue the `kubeadmz getDump` command to obtain one. Refer to [Troubleshooting IBM z/OS Container Platform](#) or [IBM z/OS Container Platform library](#) to gather additional relevant diagnostic information.

Contact IBM support once diagnostic information is obtained.

User response

Not applicable.

Problem determination

See the system programmer response.

Module

EZBXFSUB

Routing code

2, 8

Descriptor code

2

Automation

This message will go to the console and syslog. You could potentially implement automation to detect that the control connection with an external target has been severed unexpectedly and can take the appropriate actions to restore the connection or resolve the issue. Potential risk to incorrect responses can be a decrease in distributed connection throughput and server availability.

Example

```
EZD2071E ZCPA AT DVIPA 9.55.220.250 UNRESPONSIVE, SYSPLEX DISTRIBUTION STOPPED FOR THIS TARGET
```

EZD2072I**CONTROL CONNECTION TO *target_type* DESTIP *ip_address* RESET –
DISTRIBUTED DVIPA MISMATCH**

Explanation

Message EZD2072I is issued when the distributed DVIPA configured on the TCP/IP stack with the `EXTTARG` keyword does not match the distributed DVIPA configured in the external target. The connection between the TCP/IP stack and the external target is reset.

In the message text:

ip_address

The IP address of the dynamic VIPA associated with the external non-z/OS target that is configured for sysplex distribution.

target_type

The type of appliance associated with the external non-z/OS target that is configured for sysplex distribution. The possible value is ZCPA.

System action

TCP/IP continues but the external target control connection between the TCP/IP stack and the external non-z/OS target will be reset. Connections will not be distributed to the target DVIPA address specified in the message.

Operator response

Save the system log and contact the system programmer to update the TCP/IP profile or appliance configuration.

System programmer response

Compare the distributed DVIPA configured on the VIPADISTRIBUTE statement with the EXTTARG keyword and the distributed DVIPA configured in the external appliance. If these addresses do not match, take one of the following actions:

- Follow the reconfiguration workflow to update the distributed DVIPA configured on the external appliance.
- Update the corresponding VIPADISTRIBUTE statement in the TCP/IP profile.

For more information about the reconfiguration workflow, see *Managing IBM z/OS Control Plane Appliance workflows* of [IBM z/OS Container Platform library](#). For more information on how to reconfigure the distributed DVIPA on the VIPADISTRIBUTE statement of the TCP/IP profile, see [TCP/IP profile](#) in [z/OS Communications Server: IP Configuration Reference](#).

User response

Problem determination

See the system programmer response.

Module

EZBTCUTL

Routing code

2, 8

Descriptor code

12

Automation

Not applicable for automation.

Example

```
EZD2072I CONTROL CONNECTION TO ZCPA DESTIP 9.56.218.235 RESET - DISTRIBUTED DVIPA  
MISMATCH
```

EZD2073I**AT LEAST ONE ACTIVE SERVER WAS FOUND ON AN EXTERNAL TARGET**

Explanation

This message is additional information for message EZZ8471I.

The VIPADISTRIBUTE DELETE statement with the given DESTIP address is rejected because the target DESTIP has at least one active listener. When specifying one or more destination IP addresses, or the keyword ALL on the VIPADISTRIBUTE delete statement, only target addresses with no active listeners are deleted.

System action

TCP/IP continues. The VIPADISTRIBUTE DELETE statement was not processed for the destination IP address indicated in message EZZ8471I and it will remain as target for distribution.

Operator response

Issue the Netstat VDPT/-O report to check the server ready count for the distributed DVIPA and targets specified by EZZ8471I to ensure that there are no active listeners bound to the destination IP addresses that are configured for deletion on the VIPADISTRIBUTE DELETE TCP/IP profile statement.

Refer to EZZ8471I to determine which target type is preventing deletion of the VIPADISTRIBUTE statement. In the case of z/OS Control Plane Appliance (zCPA), stop the zCPA and retry. You may need to contact the Kubernetes administrator to reset or drain the appliance before it is stopped.

System programmer response

See the operator response.

User response

Not applicable.

Problem determination

See the operator response.

Example

```
EZZ8471I VIPADIST DEL 10.91.1.1 00080 9.56.218.235 REJECTED
```

```
EZD2073I AT LEAST ONE ACTIVE SERVER WAS FOUND ON AN EXTERNAL TARGET
```

EZD2074I

**VIPARANGE *ip_address* REJECTED – SAF INCONSISTENT WITH
EXISTING VIPARANGE ZCONTAINER STATEMENTS.**

Explanation

The VIPARANGE SAF parameter must either be specified on all configured VIPARANGE statements with the ZCONTAINER parameter in a TCP/IP profile, or none of them. There cannot be a mix of VIPARANGE ZCONTAINER statements with and without the SAF parameter configured. This rule applies individually to IPv4 and IPv6 VIPARANGE ZCONTAINER statements. This message is issued for one of the following two reasons:

- The SAF parameter was specified on a new VIPARANGE ZCONTAINER statement while there are existing VIPARANGE ZCONTAINER entries without the SAF parameter.
- The SAF parameter was not specified on a new VIPARANGE ZCONTAINER statement while there are existing VIPARANGE ZCONTAINER entries with the SAF parameter.

In the message text:

ip_address

The configured IPv4 or IPv6 address for the VIPARANGE statement in error.

System action:

TCP/IP continues. The VIPARANGE statement indicated by the message text is not processed and its range of IP addresses is not available for use.

Operator response:

Issue the Netstat VIPADCFG/-F command. Provide this message and the output of the Netstat command to the system programmer for problem determination.

System programmer response:

Update the relevant VIPARANGE definitions in the TCP/IP profile.

User response:

Not applicable.

Problem determination:

See the operator response.

Module:

EZBXFDVI, EZBX6DVI

Routing code:

2, 8

Descriptor code:

12

Automation:

Not applicable for automation.

Example

```
EZD2074I VIPARANGE 9.53.214.240 REJECTED - SAF INCONSISTENT WITH EXISTING VIPARANGE  
ZCONTAINER STATEMENTS
```

EZD2075I

**VIPARANGE *ip_address range_type1* REJECTED – IDENTICAL
VIPARANGE ALREADY DEFINED FOR *range_type2* APPLICATIONS.**

Explanation

To modify an existing VIPARANGE statement for the same IP address and mask/prefix length (IPv4/IPv6 respectively), the optional parameter that identifies the type of application that can request addresses from this range (ZCX, ZCONTAINER, or ZCPA) must match between the base statement and the modifying statement. If they do not match, message EZD2075I is issued to indicate that the modification has been rejected. For example, if you use the VARY TCPIP, OBEYFILE command to modify an existing VIPARANGE statement that is configured with the ZCONTAINER parameter in the base profile, the new VIPARANGE statement must also have the ZCONTAINER parameter.

In the message text:

ip_address

The configured IPv4 or IPv6 address for the VIPARANGE statement being modified.

range_type1

The type of VIPARANGE specified. The possible values are ZCPA, ZCX, ZCONT, and BASE (when no value is specified for this parameter on the VIPARANGE statement).

range_type2

The type of VIPARANGE for the existing configuration. The possible values are ZCPA, ZCX, ZCONT, and BASE (when no value is specified for this parameter on the VIPARANGE statement).

System action:

TCP/IP continues.

Operator response:

Issue the Netstat VIPADCFG/-F command. Provide this message and the output of the Netstat command to the system programmer for problem determination.

System programmer response:

Update the relevant VIPARANGE definitions in the TCP/IP profile.

User response:

Not applicable.

Problem determination:

See the operator response.

Module:

EZBXFDVI, EZBX6DVI

Routing code:

2, 8

Descriptor code:

12

Automation:

Not applicable for automation.

Example

```
EZD2075I VIPARANGE 9.53.214.240 ZCONT REJECTED - IDENTICAL VIPARANGE ALREADY DEFINED FOR  
ZCX APPLICATIONS.
```

EZD2076I

**INTERFACE interface FAILED – ALTERNATE PATH SWAP SIGNAL
RECEIVED.**

Explanation

TCP/IP has received a signal from the device indicating that this interface is undergoing an Alternate Path (AP) SWAP to recover from a catastrophic failure. When the AP SWAP is completed, an inoperative condition will be presented by OSH, the TCP/IP stack will be notified, and the device will be recovered automatically.

In the message text:

interface name

The name of the interface.

System action:

Following the completion of the AP SWAP, the device is automatically recovered.

Operator response:

No action is needed. The device is automatically recovered by the TCP/IP stack.

System programmer response:

No action is needed. The device is automatically recovered by the TCP/IP stack.

User response:

Not applicable.

Problem determination:

Not applicable.

Source:

TCP/IP

Module:

EZBIFIND

Routing code:

2, 8

Descriptor code:

12

Automation:

Not applicable for automation.

Example

```
EZD2076I INTERFACE EQTCP4 FAILED - ALTERNATE PATH SWAP SIGNAL RECEIVED
```

Appendix A. Related protocol specifications

This appendix lists the related protocol specifications (RFCs) for TCP/IP. The Internet Protocol suite is still evolving through requests for comments (RFC). New protocols are being designed and implemented by researchers and are brought to the attention of the Internet community in the form of RFCs. Some of these protocols are so useful that they become recommended protocols. That is, all future implementations for TCP/IP are recommended to implement these particular functions or protocols. These become the *de facto* standards, on which the TCP/IP protocol suite is built.

RFCs are available at <http://www.rfc-editor.org/rfc.html>.

Draft RFCs that have been implemented in this and previous Communications Server releases are listed at the end of this topic.

Many features of TCP/IP Services are based on the following RFCs:

RFC

Title and Author

RFC 652

Telnet output carriage-return disposition option D. Crocker

RFC 653

Telnet output horizontal tabstops option D. Crocker

RFC 654

Telnet output horizontal tab disposition option D. Crocker

RFC 655

Telnet output formfeed disposition option D. Crocker

RFC 657

Telnet output vertical tab disposition option D. Crocker

RFC 658

Telnet output linefeed disposition D. Crocker

RFC 698

Telnet extended ASCII option T. Mock

RFC 726

Remote Controlled Transmission and Echoing Telnet option J. Postel, D. Crocker

RFC 727

Telnet logout option M.R. Crispin

RFC 732

Telnet Data Entry Terminal option J.D. Day

RFC 733

Standard for the format of ARPA network text messages D. Crocker, J. Vittal, K.T. Pogran, D.A. Henderson

RFC 734

SUPDUP Protocol M.R. Crispin

RFC 735

Revised Telnet byte macro option D. Crocker, R.H. Gumpertz

RFC 736

Telnet SUPDUP option M.R. Crispin

RFC 749

Telnet SUPDUP—Output option B. Greenberg

Domain Name System Security Extensions D. Eastlake 3rd, C. Kaufman
- RFC 2066**
TELNET CHARSET Option R. Gellens

RFC 2080

RIPng for IPv6 G. Malkin, R. Minnear

RFC 2096

IP Forwarding Table MIB F. Baker

RFC 2104

HMAC: Keyed-Hashing for Message Authentication H. Krawczyk, M. Bellare, R. Canetti

RFC 2119

Keywords for use in RFCs to Indicate Requirement Levels S. Bradner

RFC 2133

Basic Socket Interface Extensions for IPv6 R. Gilligan, S. Thomson, J. Bound, W. Stevens

RFC 2136

Dynamic Updates in the Domain Name System (DNS UPDATE) P. Vixie, Ed., S. Thomson, Y. Rekhter, J. Bound

RFC 2137

Secure Domain Name System Dynamic Update D. Eastlake 3rd

RFC 2163

Using the Internet DNS to Distribute MIXER Conformant Global Address Mapping (MCGAM) C. Allocchio

RFC 2168

Resolution of Uniform Resource Identifiers using the Domain Name System R. Daniel, M. Mealling

RFC 2178

OSPF Version 2 J. Moy

RFC 2181

Clarifications to the DNS Specification R. Elz, R. Bush

RFC 2205

Resource ReSerVation Protocol (RSVP)—Version 1 Functional Specification R. Braden, Ed., L. Zhang, S. Berson, S. Herzog, S. Jamin

RFC 2210

The Use of RSVP with IETF Integrated Services J. Wroclawski

RFC 2211

Specification of the Controlled-Load Network Element Service J. Wroclawski

RFC 2212

Specification of Guaranteed Quality of Service S. Shenker, C. Partridge, R. Guerin

RFC 2215

General Characterization Parameters for Integrated Service Network Elements S. Shenker, J. Wroclawski

RFC 2217

Telnet Com Port Control Option G. Clarke

RFC 2219

Use of DNS Aliases for Network Services M. Hamilton, R. Wright

RFC 2228

FTP Security Extensions M. Horowitz, S. Lunt

RFC 2230

Key Exchange Delegation Record for the DNS R. Atkinson

RFC 2233

The Interfaces Group MIB using SMIV2 K. McCloghrie, F. Kastenholz

RFC 2240

A Legal Basis for Domain Name Allocation O. Vaughn

RFC 2246

The TLS Protocol Version 1.0 T. Dierks, C. Allen

RFC 2251

Lightweight Directory Access Protocol (v3) M. Wahl, T. Howes, S. Kille

RFC 2253

Lightweight Directory Access Protocol (v3): UTF-8 String Representation of Distinguished Names M. Wahl, S. Kille, T. Howes

RFC 2254

The String Representation of LDAP Search Filters T. Howes

RFC 2261

An Architecture for Describing SNMP Management Frameworks D. Harrington, R. Presuhn, B. Wijnen

RFC 2262

Message Processing and Dispatching for the Simple Network Management Protocol (SNMP) J. Case, D. Harrington, R. Presuhn, B. Wijnen

RFC 2271

An Architecture for Describing SNMP Management Frameworks D. Harrington, R. Presuhn, B. Wijnen

RFC 2273

SNMPv3 Applications D. Levi, P. Meyer, B. Stewartz

RFC 2274

User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3) U. Blumenthal, B. Wijnen

RFC 2275

View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP) B. Wijnen, R. Presuhn, K. McCloghrie

RFC 2279

UTF-8, a transformation format of ISO 10646 F. Yergeau

RFC 2292

Advanced Sockets API for IPv6 W. Stevens, M. Thomas

RFC 2308

Negative Caching of DNS Queries (DNS NCACHE) M. Andrews

RFC 2317

Classless IN-ADDR.ARPA delegation H. Eidnes, G. de Groot, P. Vixie

RFC 2320

Definitions of Managed Objects for Classical IP and ARP Over ATM Using SMIPv2 (IPOA-MIB) M. Greene, J. Luciani, K. White, T. Kuo

RFC 2328

OSPF Version 2 J. Moy

RFC 2345

Domain Names and Company Name Retrieval J. Klensin, T. Wolf, G. Oglesby

RFC 2352

A Convention for Using Legal Names as Domain Names O. Vaughn

RFC 2355

TN3270 Enhancements B. Kelly

RFC 2358

Definitions of Managed Objects for the Ethernet-like Interface Types J. Flick, J. Johnson

RFC 2373

IP Version 6 Addressing Architecture R. Hinden, S. Deering

RFC 2374

An IPv6 Aggregatable Global Unicast Address Format R. Hinden, M. O'Dell, S. Deering

RFC 2375

IPv6 Multicast Address Assignments R. Hinden, S. Deering

RFC 2385

Protection of BGP Sessions via the TCP MD5 Signature Option A. Hefferman

RFC 2389

Feature negotiation mechanism for the File Transfer Protocol P. Hethmon, R. Elz

RFC 2401

Security Architecture for Internet Protocol S. Kent, R. Atkinson

RFC 2402

IP Authentication Header S. Kent, R. Atkinson

RFC 2403

The Use of HMAC-MD5-96 within ESP and AH C. Madson, R. Glenn

RFC 2404

The Use of HMAC-SHA-1-96 within ESP and AH C. Madson, R. Glenn

RFC 2405

The ESP DES-CBC Cipher Algorithm With Explicit IV C. Madson, N. Doraswamy

RFC 2406

IP Encapsulating Security Payload (ESP) S. Kent, R. Atkinson

RFC 2407

The Internet IP Security Domain of Interpretation for ISAKMPD Piper

RFC 2408

Internet Security Association and Key Management Protocol (ISAKMP) D. Maughan, M. Schertler, M. Schneider, J. Turner

RFC 2409

The Internet Key Exchange (IKE) D. Harkins, D. Carrel

RFC 2410

The NULL Encryption Algorithm and Its Use With IPsec R. Glenn, S. Kent,

RFC 2428

FTP Extensions for IPv6 and NATs M. Allman, S. Ostermann, C. Metz

RFC 2445

Internet Calendaring and Scheduling Core Object Specification (iCalendar) F. Dawson, D. Stenerson

RFC 2459

Internet X.509 Public Key Infrastructure Certificate and CRL Profile R. Housley, W. Ford, W. Polk, D. Solo

RFC 2460

Internet Protocol, Version 6 (IPv6) Specification S. Deering, R. Hinden

RFC 2461

Neighbor Discovery for IP Version 6 (IPv6) T. Narten, E. Nordmark, W. Simpson

RFC 2462

IPv6 Stateless Address Autoconfiguration S. Thomson, T. Narten

RFC 2463

Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification A. Conta, S. Deering

RFC 2464

Transmission of IPv6 Packets over Ethernet Networks M. Crawford

RFC 2466

Management Information Base for IP Version 6: ICMPv6 Group D. Haskin, S. Onishi

RFC 2476

Message Submission R. Gellens, J. Klensin

RFC 2487

SMTP Service Extension for Secure SMTP over TLS P. Hoffman

RFC 2505

Anti-Spam Recommendations for SMTP MTAs G. Lindberg

Cryptographic Algorithm Implementation Requirements for Encapsulating Security Payload (ESP) and Authentication Header (AH) V. Manral

RFC 4862

IPv6 Stateless Address Autoconfiguration S. Thomson, T. Narten, T. Jinmei

RFC 4868

Using HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512 with IPsec S. Kelly, S. Frankel

RFC 4869

Suite B Cryptographic Suites for IPsec L. Law, J. Solinas

RFC 4941

Privacy Extensions for Stateless Address Autoconfiguration in IPv6 T. Narten, R. Draves, S. Krishnan

RFC 4945

The Internet IP Security PKI Profile of IKEv1/ISAKMP, IKEv2, and PKIX B. Korver

RFC 5014

IPv6 Socket API for Source Address Selection E. Nordmark, S. Chakrabarti, J. Laganier

RFC 5095

Deprecation of Type 0 Routing Headers in IPv6 J. Abley, P. Savola, G. Neville-Neil

RFC 5175

IPv6 Router Advertisement Flags Option B. Haberman, Ed., R. Hinden

RFC 5282

Using Authenticated Encryption Algorithms with the Encrypted Payload of the Internet Key Exchange version 2 (IKEv2) Protocol D. Black, D. McGrew

RFC 5996

Internet Key Exchange Protocol Version 2 (IKEv2) C. Kaufman, P. Hoffman, Y. Nir, P. Eronen

RFC 7627

Transport Layer Security (TLS) Session Hash and Extended Master Secret Extension K. Bhargavan, A. Delignat-Lavaud, A. Pironti, Inria Paris-Rocquencourt, A. Langley, M. Ray

RFC 8446

The Transport Layer Security (TLS) Protocol Version 1.3 E. Rescorla

Internet drafts

Internet drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Other groups can also distribute working documents as Internet drafts. You can see Internet drafts at <http://www.ietf.org/ID.html>.

Appendix B. Accessibility

Accessible publications for this product are offered through [IBM Documentation for z/OS](#).

If you experience difficulty with the accessibility of any z/OS documentation see [How to Send Feedback to IBM](#) to leave documentation feedback.

Notices

This information was developed for products and services that are offered in the USA or elsewhere.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing IBM Corporation North Castle Drive, MD-NC119 Armonk, NY 10504-1785 United States of America

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing Legal and Intellectual Property Law IBM Japan Ltd. 19-21, Nihonbashi-Hakozakicho, Chuo-ku Tokyo 103-8510, Japan

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

This information could include missing, incorrect, or broken hyperlinks. Hyperlinks are maintained in only the HTML plug-in output for the IBM Documentation. Use of hyperlinks in other output formats of this information is at your own risk.

Any references in this information to non-IBM websites are provided for convenience only and do not in any manner serve as an endorsement of those websites. The materials at those websites are not part of the materials for this IBM product and use of those websites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Corporation Site Counsel 2455 South Road Poughkeepsie, NY 12601-5400 USA

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

Terms and conditions for product documentation

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability

These terms and conditions are in addition to any terms of use for the IBM website.

Personal use

You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

Commercial use

You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

IBM Online Privacy Statement

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user's name, email address, phone number, or other personally identifiable information for purposes of enhanced user usability and single sign-on configuration. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at ibm.com/privacy and IBM's Online Privacy Statement at ibm.com/privacy/details in the section entitled "Cookies, Web Beacons and Other Technologies," and the "IBM Software Products and Software-as-a-Service Privacy Statement" at ibm.com/software/info/product-privacy.

Policy for unsupported hardware

Various z/OS elements, such as DFSMS, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Minimum supported hardware

The minimum supported hardware for z/OS releases identified in z/OS announcements can subsequently change when service for particular servers or devices is withdrawn. Likewise, the levels of other software products supported on a particular release of z/OS are subject to the service support lifecycle of those products. Therefore, z/OS and its product publications (for example, panels, samples, messages, and product documentation) can include references to hardware and software that is no longer supported.

- For information about software support lifecycle, see: [IBM Lifecycle Support for z/OS \(www.ibm.com/software/support/systemsz/lifecycle\)](http://www.ibm.com/software/support/systemsz/lifecycle)
- For information about currently-supported IBM hardware, contact your IBM representative.

Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Trademarks

A current list of IBM trademarks is available on the web at [Copyright and trademark information at www.ibm.com/legal/copytrade.shtml](http://www.ibm.com/legal/copytrade.shtml).

Bibliography

This bibliography contains descriptions of the documents in the z/OS Communications Server library.

z/OS Communications Server documentation is available online at the z/OS Internet Library web page at <http://www.ibm.com/systems/z/os/zos/library/bkserv/>.

z/OS Communications Server library updates

Updates to documents are also available on RETAIN and in information APARs (info APARs). Go to <https://www.ibm.com/mysupport> to view information APARs.

z/OS Communications Server information

z/OS Communications Server product information is grouped by task in the following tables.

Planning

Title	Number	Description
z/OS Communications Server: New Function Summary	GC27-3664	This document is intended to help you plan for new IP or SNA functions, whether you are migrating from a previous version or installing z/OS for the first time. It summarizes what is new in the release and identifies the suggested and required modifications needed to use the enhanced functions.
z/OS Communications Server: IPv6 Network and Appl Design Guide	SC27-3663	This document is a high-level introduction to IPv6. It describes concepts of z/OS Communications Server's support of IPv6, coexistence with IPv4, and migration issues.

Resource definition, configuration, and tuning

Title	Number	Description
z/OS Communications Server: IP Configuration Guide	SC27-3650	This document describes the major concepts involved in understanding and configuring an IP network. Familiarity with the z/OS operating system, IP protocols, z/OS UNIX System Services, and IBM Time Sharing Option (TSO) is recommended. Use this document with the z/OS Communications Server: IP Configuration Reference .

Title	Number	Description
z/OS Communications Server: IP Configuration Reference	SC27-3651	This document presents information for people who want to administer and maintain IP. Use this document with the z/OS Communications Server: IP Configuration Guide . The information in this document includes: <ul style="list-style-type: none"> • TCP/IP configuration data sets • Configuration statements • Translation tables • Protocol number and port assignments
z/OS Communications Server: SNA Network Implementation Guide	SC27-3672	This document presents the major concepts involved in implementing an SNA network. Use this document with the z/OS Communications Server: SNA Resource Definition Reference .
z/OS Communications Server: SNA Resource Definition Reference	SC27-3675	This document describes each SNA definition statement, start option, and macroinstruction for user tables. It also describes NCP definition statements that affect SNA. Use this document with the z/OS Communications Server: SNA Network Implementation Guide .
z/OS Communications Server: SNA Resource Definition Samples	SC27-3676	This document contains sample definitions to help you implement SNA functions in your networks, and includes sample major node definitions.
z/OS Communications Server: IP Network Print Facility	SC27-3658	This document is for systems programmers and network administrators who need to prepare their network to route SNA, JES2, or JES3 printer output to remote printers using TCP/IP Services.

Operation

Title	Number	Description
z/OS Communications Server: IP User's Guide and Commands	SC27-3662	This document describes how to use TCP/IP applications. It contains requests with which a user can log on to a remote host using Telnet, transfer data sets using FTP, send electronic mail, print on remote printers, and authenticate network users.
z/OS Communications Server: IP System Administrator's Commands	SC27-3661	This document describes the functions and commands helpful in configuring or monitoring your system. It contains system administrator's commands, such as TSO NETSTAT, PING, TRACERTE and their UNIX counterparts. It also includes TSO and MVS commands commonly used during the IP configuration process.
z/OS Communications Server: SNA Operation	SC27-3673	This document serves as a reference for programmers and operators requiring detailed information about specific operator commands.
z/OS Communications Server: Quick Reference	SC27-3665	This document contains essential information about SNA and IP commands.

Customization

Title	Number	Description
z/OS Communications Server: SNA Customization	SC27-3666	<p>This document enables you to customize SNA, and includes the following information:</p> <ul style="list-style-type: none"> • Communication network management (CNM) routing table • Logon-interpret routine requirements • Logon manager installation-wide exit routine for the CLU search exit • TSO/SNA installation-wide exit routines • SNA installation-wide exit routines

Writing application programs

Title	Number	Description
z/OS Communications Server: IP Sockets Application Programming Interface Guide and Reference	SC27-3660	This document describes the syntax and semantics of program source code necessary to write your own application programming interface (API) into TCP/IP. You can use this interface as the communication base for writing your own client or server application. You can also use this document to adapt your existing applications to communicate with each other using sockets over TCP/IP.
z/OS Communications Server: IP CICS Sockets Guide	SC27-3649	This document is for programmers who want to set up, write application programs for, and diagnose problems with the socket interface for CICS® using z/OS TCP/IP.
z/OS Communications Server: IP IMS Sockets Guide	SC27-3653	This document is for programmers who want application programs that use the IMS TCP/IP application development services provided by the TCP/IP Services of IBM.
z/OS Communications Server: IP Programmer's Guide and Reference	SC27-3659	This document describes the syntax and semantics of a set of high-level application functions that you can use to program your own applications in a TCP/IP environment. These functions provide support for application facilities, such as user authentication, distributed databases, distributed processing, network management, and device sharing. Familiarity with the z/OS operating system, TCP/IP protocols, and IBM Time Sharing Option (TSO) is recommended.
z/OS Communications Server: SNA Programming	SC27-3674	This document describes how to use SNA macroinstructions to send data to and receive data from (1) a terminal in either the same or a different domain, or (2) another application program in either the same or a different domain.
z/OS Communications Server: SNA Programmer's LU 6.2 Guide	SC27-3669	This document describes how to use the SNA LU 6.2 application programming interface for host application programs. This document applies to programs that use only LU 6.2 sessions or that use LU 6.2 sessions along with other session types. (Only LU 6.2 sessions are covered in this document.)
z/OS Communications Server: SNA Programmer's LU 6.2 Reference	SC27-3670	This document provides reference material for the SNA LU 6.2 programming interface for host application programs.

Title	Number	Description
z/OS Communications Server: CSM Guide	SC27-3647	This document describes how applications use the communications storage manager.

Diagnosis

Title	Number	Description
z/OS Communications Server: IP Diagnosis Guide	GC27-3652	This document explains how to diagnose TCP/IP problems and how to determine whether a specific problem is in the TCP/IP product code. It explains how to gather information for and describe problems to the IBM Software Support Center.
z/OS Communications Server: ACF/TAP Trace Analysis Handbook	GC27-3645	This document explains how to gather the trace data that is collected and stored in the host processor. It also explains how to use the Advanced Communications Function/Trace Analysis Program (ACF/TAP) service aid to produce reports for analyzing the trace data information.
z/OS Communications Server: SNA Diagnosis Vol 1, Techniques and Procedures and z/OS Communications Server: SNA Diagnosis Vol 2, FFST Dumps and the VIT	GC27-3667 GC27-3668	These documents help you identify an SNA problem, classify it, and collect information about it before you call the IBM Support Center. The information collected includes traces, dumps, and other problem documentation.
z/OS Communications Server: SNA Data Areas Volume 1 and z/OS Communications Server: SNA Data Areas Volume 2	GC31-6852 GC31-6853	These documents describe SNA data areas and can be used to read an SNA dump. They are intended for IBM programming service representatives and customer personnel who are diagnosing problems with SNA.

Messages and codes

Title	Number	Description
z/OS Communications Server: SNA Messages	SC27-3671	This document describes the ELM, IKT, IST, IUT, IVT, and USS messages. Other information in this document includes: <ul style="list-style-type: none"> • Command and RU types in SNA messages • Node and ID types in SNA messages • Supplemental message-related information
z/OS Communications Server: IP Messages Volume 1 (EZA)	SC27-3654	This volume contains TCP/IP messages beginning with EZA.
z/OS Communications Server: IP Messages Volume 2 (EZB, EZD)	SC27-3655	This volume contains TCP/IP messages beginning with EZB or EZD.
z/OS Communications Server: IP Messages Volume 3 (EZY)	SC27-3656	This volume contains TCP/IP messages beginning with EZY.
z/OS Communications Server: IP Messages Volume 4 (EZZ, SNM)	SC27-3657	This volume contains TCP/IP messages beginning with EZZ and SNM.
z/OS Communications Server: IP and SNA Codes	SC27-3648	This document describes codes and other information that appear in z/OS Communications Server messages.

Product Number: 5655-ZOS

SC27-3655-70
